

# Clinical NLP (Classic Approaches)

---

March 2, 2023

Peter Szolovits

**Massachusetts  
Institute of  
Technology**

# Outline

---

- Today
  - **Value of the data in clinical text**
  - Hyper-simplified linguistics
  - Term spotting + handling negation, uncertainty
  - ML to expand terms
  - pre-NN ML to identify entities and relations
  - language models
  - vector space embeddings based on co-occurrence
  - adding context to help with disambiguation
  - from embedding single words to phrases, sentences, etc.
- Next time:
  - attention and transformers
  - very large language models
  - value of domain specificity

# What do We Want from Clinical NLP?

---

- Extract structured data from narrative text
  - E.g., billing codes from notes; symptoms from narratives, plans from doctors' and nurses' notes
- Generate narrative text from structured data (??!!)
- Generate reports from non-narratives (imaging, signals, ...)
- Combine text models with other data to create models for cohort selection, outcome prediction, ...
- Summarize vast numbers of notes to what's important. (For what use cases?)
- Question answering

# Bulk of Valuable Data are in Narrative Text

---

orange=demographics

blue=patient condition, diseases, etc.

brown=procedures, tests

magenta=results of measurements

purple=time

Mr. Blind is a 79-year-old white white male with a history of diabetes mellitus, inferior myocardial infarction, who underwent open repair of his increased diverticulum November 13th at Sephsandpot Center.

The patient developed hematemesis November 15th and was intubated for respiratory distress. He was transferred to the Valtawnprinceel Community Memorial Hospital for endoscopy and esophagoscopy on the 16th of November which showed a 2 cm linear tear of the esophagus at 30 to 32 cm. The patient's hematocrit was stable and he was given no further intervention.

The patient attempted a gastrografin swallow on the 21st, but was unable to cooperate with probable aspiration. The patient also had been receiving generous intravenous hydration during the period for which he was NPO for his esophageal tear and intravenous Lasix for a question of pulmonary congestion.

On the morning of the 22nd the patient developed tachypnea with a chest X-ray showing a question of congestive heart failure. A medical consult was obtained at the Valtawnprinceel Community Memorial Hospital. The patient was given intravenous Lasix.

# Selection of Rheumatoid Arthritis Cohort

**Table 4. Comparison of performance characteristics from validation of the complete classification algorithm (narrative and codified) with algorithms containing codified-only and narrative-only data\***

<b>Model</b>	<b>RA by algorithm or criteria, no.</b>	<b>PPV (95% CI), %</b>	<b>Sensitivity (95% CI), %</b>	<b>Difference in PPV (95% CI), %†</b>
<b>Algorithms</b>				
Narrative and codified (complete)	3,585	94 (91–96)	63 (51–75)	Reference
Codified only	3,046	88 (84–92)	51 (42–60)	6 (2–9)‡
NLP only	3,341	89 (86–93)	56 (46–66)	5 (1–8)‡
<b>Published administrative codified criteria</b>				
≥3 ICD-9 RA codes	7,960	56 (47–64)	80 (72–88)	38 (29–47)‡
≥1 ICD-9 RA codes plus ≥1 DMARD	7,799	45 (37–53)	66 (57–76)	49 (40–57)‡

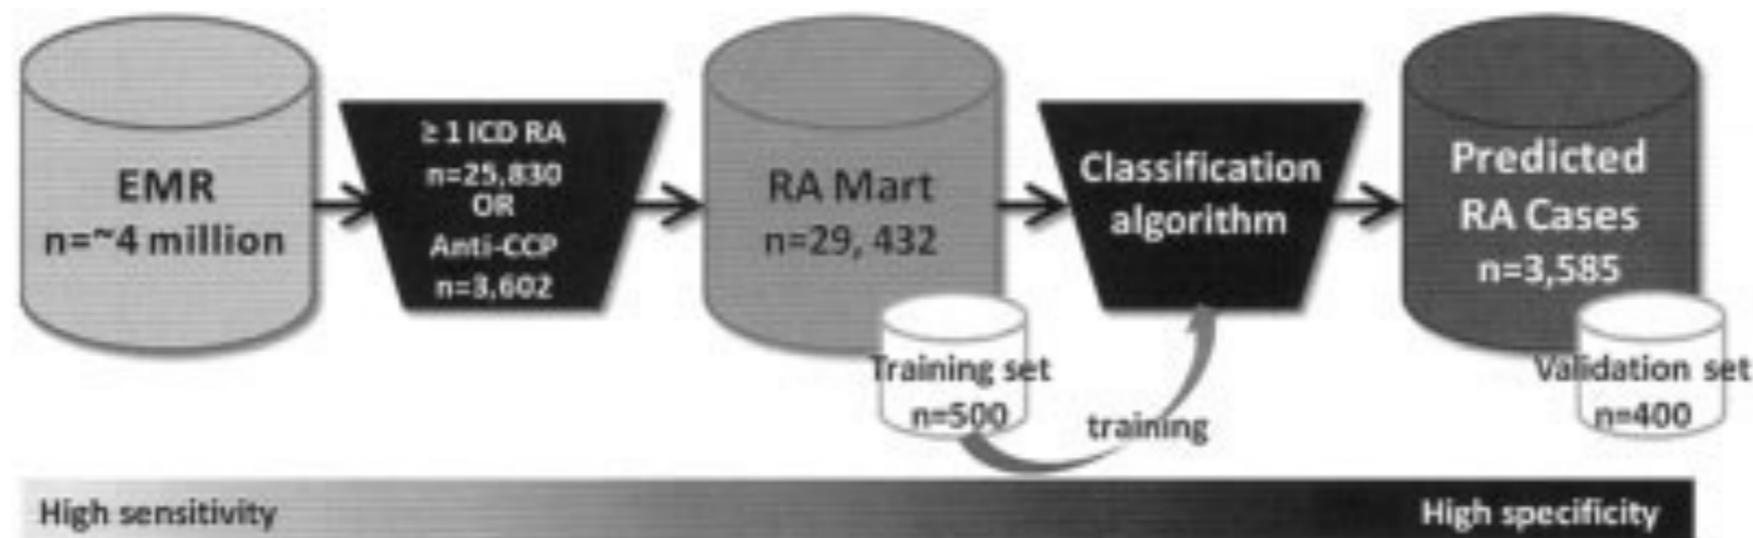

\* The complete classification algorithm was also compared with criteria for RA used in published administrative database studies. RA = rheumatoid arthritis; PPV = positive predictive value; 95% CI = 95% confidence interval; NLP = natural language processing; ICD-9 = International Classification of Diseases, Ninth Revision; DMARD = disease-modifying antirheumatic drug.

† Difference in PPV = PPV of complete algorithm – comparison algorithm or criteria.

‡ Significant difference in PPV compared with the complete algorithm.

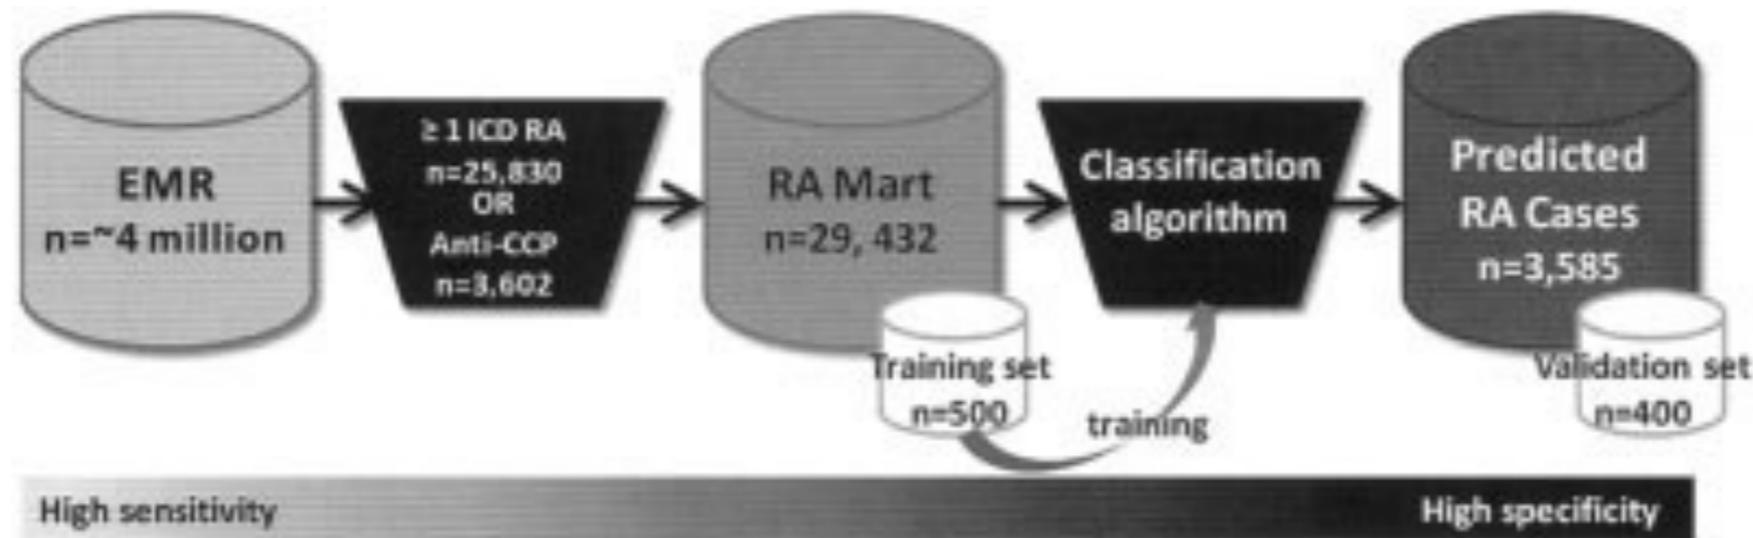

Liao, K. P., Cai, T., Gainer, V., Goryachev, S., Zeng-Treitler, Q., Raychaudhuri, S., Szolovits, P., Churchill, S., Murphy, S., Kohane, I., Karlson, E., Plenge, R. (2010). Electronic medical records for discovery research in rheumatoid arthritis. *Arthritis Care & Research*, 62(8), 1120–1127. <http://doi.org/10.1002/acr.20184>

# Finding a Cohort of Rheumatoid Arthritis Cases

- Coded data:
  - ICD-9 codes, including RA and related diseases
    - ignore codes within 1 week of previous code
  - electronic prescriptions for
    - DMARDs: methotrexate, azathioprine, leflunomide, sulfasalazine, hydroxychloroquine, penicillamine, cyclosporine, and gold
    - Biologic agents: anti-TNF agents infliximab and etanercept, and abatacept, rituximab, anakinra, etc.
  - anti-cyclic citrullinated peptide (anti-CCP) & rheumatoid factor (RF) labs
  - total number of “facts” in the EMR

# Finding a Cohort of Rheumatoid Arthritis Cases

- Narrative text data (processed by HITEx)
  - From health care provider notes, radiology reports, pathology reports, discharge summaries, and operative reports
  - Extracted **disease diagnoses** (RA, SLE, PsA, and JRA)
  - **medications** (same as from prescriptions, with the addition of adalimumab)
  - **laboratory data** (RF, anti-CCP, and the term “seropositive”)
  - **radiology findings** of erosions on radiographs
- Hand-made lists of equivalent terms
- Negation detection, including special terms, e.g., “RF-”

Zeng QT, Goryachev S, Weiss S, Sordo M, Murphy SN, Lazarus R. Extracting principal diagnosis, co-morbidity and smoking status for asthma research: evaluation of a natural language processing system. BMC Med Inform Decis Mak 2006;6:30.

**Table 3. Variables selected for the complete algorithm (narrative and codified EMR data) from the logistic regression in order of predictive value\***

Variable	Standardized regression coefficient	Standard error
Positive predictors		
NLP RA	1.11	0.48
NLP seropositive	0.74	0.26
ICD-9 RA normalized†	0.71	0.23
ICD-9 RA	0.66	0.44
NLP erosions	0.46	0.29
Codified RF negative	0.36	0.36
NLP methotrexate	0.3	0.34
Codified anti-TNF‡	0.29	0.3
NLP anti-CCP positive	0.27	0.25
NLP anti-TNF§	0.2	0.36
NLP other DMARDs	0.13	0.34
Negative predictors		
ICD-9 JRA	-0.98	0.9
ICD-9 SLE	-0.57	1.09
NLP PsA	-0.51	0.74

\* EMR = electronic medical record; NLP = natural language processing; RA = rheumatoid arthritis; ICD-9 = International Classification of Diseases, Ninth Revision; RF = rheumatoid factor; anti-TNF = anti-tumor necrosis factor; anti-CCP = anti-cyclic citrullinated peptide; DMARDs = disease-modifying antirheumatic drugs; JRA = juvenile rheumatoid arthritis; SLE = systemic lupus erythematosus; PsA = psoriatic arthritis.

† ICD-9 RA normalized =  $\ln$  (no. of ICD-9 RA codes per subject  $\geq 1$  week apart).

‡ Codified anti-TNF = etanercept and infliximab (adalimumab was not available in our EMR).

§ NLP anti-TNF = adalimumab, etanercept, and infliximab.

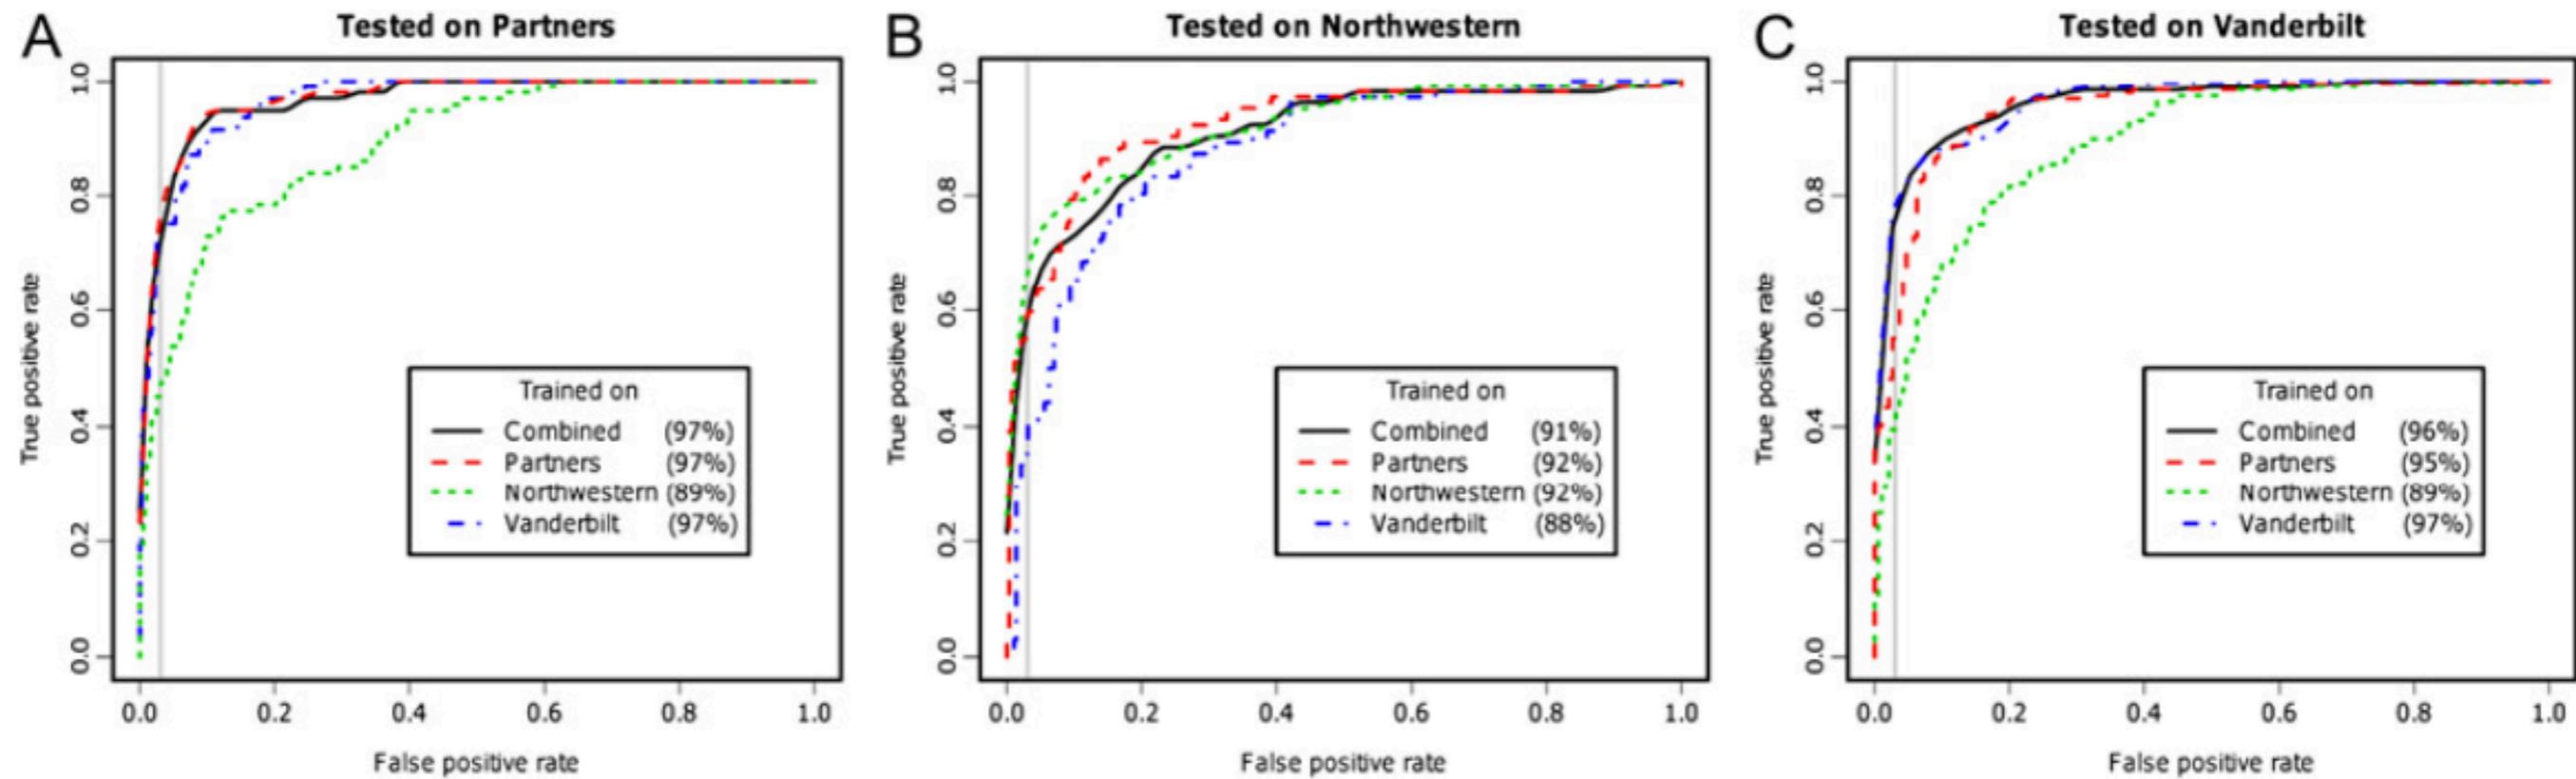

# Algorithm for RA was Portable (!)

---

- Study replicated at Vanderbilt and Northwestern

	Partners	Northwestern	Vanderbilt
EHR	Local	Epic (inpatient) Cerner (outpatient)	Local
# Patients	4M	2.2M	1.7M
Meds	Structured meds entries (in- and outpatient) and text queries	Structured outpatient meds entries and in- and outpatient text queries	NLP (MedEx) for outpatient medications and structured inpatient records
NLP Queries	Custom RegEx	Custom RegEx from Partners	Generic UMLS concepts, derived from KnowledgeMap web interface

Carroll, R. J., Thompson, W. K., Eyler, A. E., Mandelin, A. M., Cai, T., Zink, R. M., et al. (2012). Portability of an algorithm to identify rheumatoid arthritis in electronic health records. *Journal of the American Medical Informatics Association*, 19(e1), e162–9. <http://doi.org/10.1136/amiajnl-2011-000583>

**Figure 3** Receiver operating characteristic curves for each test set. The vertical line represents the 97% specificity cut-off used in this study. The test performance at Partners, Northwestern, and Vanderbilt are found in (a), (b), and (c), respectively.

# Warning: Telegraphic Language

(Barrows00)

---

3/11/98 IPN	
SOB & DOE ↓	
VSS, AF	
CXR ⊕ LLL ASD no Δ	
WBC 11K	
S/B Cx ⊕ GPC c/w PC, no GNR	
D/C Cef → PCN IV	

# Telegraphic Language

---

3/11/98 IPN	(date of) Intern Progress Note,
SOB & DOE ↓	the patient's shortness of breath and dyspnea on exertion are decreased,
VSS, AF	the patient's vital signs are stable and the patient is afebrile,
CXR ⊕ LLL ASD no Δ	a recent new chest xray shows a left lower lobe air space density that is unchanged from the previous radiograph,
WBC 11K	a recent new white blood cell count is 11,000 cells per cubic milliliter,
S/B Cx ⊕ GPC c/w PC, no GNR	the patient's sputum and blood cultures are positive for gram positive cocci consistent with pneumococcus, no gram negative rods have grown,
D/C Cef →PCN IV	so the plan is to discontinue the cefazolin and then begin penicillin treatment intravenously.

# Typical Goals of Clinical NLP

---

- for any word or phrase, assign it a meaning (or null) from some taxonomy/ontology/terminology;
  - e.g., “rheumatoid arthritis” ==> 714.0 (ICD9)
- for any word or phrase, determine whether it represents protected health information;
  - e.g., “Mr. Huntington suffers from Huntington’s Disease”
- determine aspects of each entity: time, location, certainty, ...
- having identified two meaningful phrases in a sentence, determine the relationship (or null) between them;
  - e.g., precedes, causes, treats, prevents, indicates, ...
  - note: we also need a taxonomy of relationships
- in a larger document, identify the sentences or fragments most relevant to answering a specific medical question;
  - e.g., where is the patient’s exercise regimen discussed?
- summarization
  - as data sets balloon in size, how to provide a meaningful overview
- a step in further learning models
  - topic modeling
  - vector-space embedding

# Two Types of Tasks

---

- Every word counts
  - De-identification
  - Extraction of all
    - entities
    - time
    - certainty
    - causation and association
- Aggregate judgment
  - E.g., “smoking” challenge
    - Most text may be irrelevant to specific result
  - Cohort selection—does a patient satisfy some set of inclusion and exclusion criteria
    - Often definite presence of a disease, complication, ...

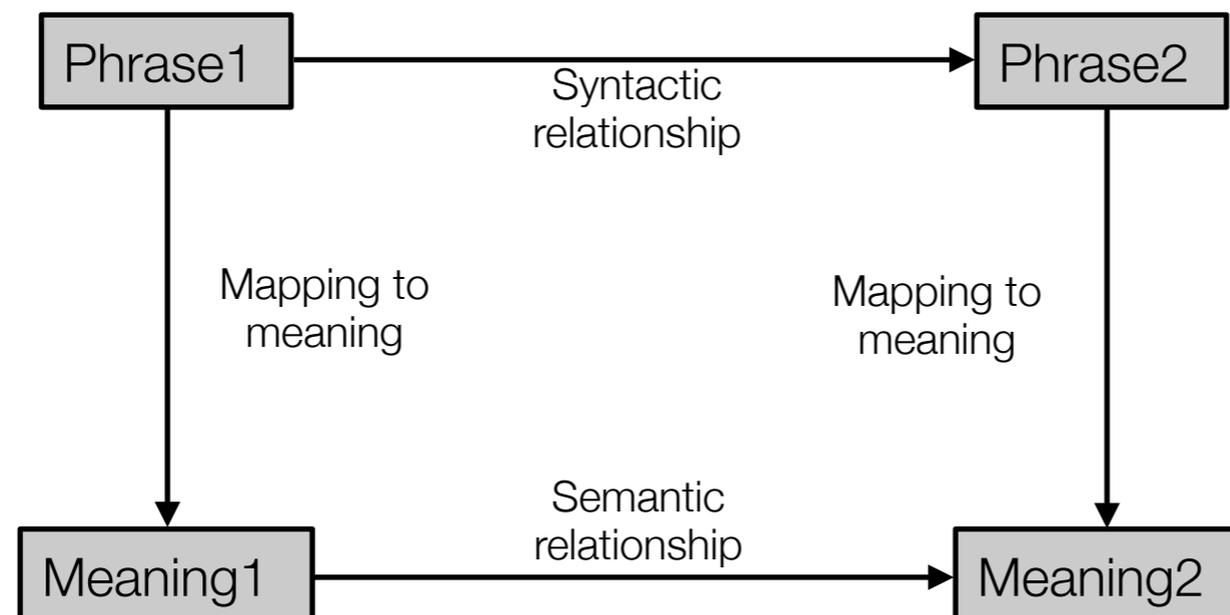

# Outline

---

- Value of the data in clinical text
- **Hyper-simplified linguistics**
- Term spotting + handling negation, uncertainty
- ML to expand terms
- pre-NN ML to identify entities and relations
- language models
- vector space embeddings based on co-occurrence
- adding context to help with disambiguation
- from embedding single words to phrases, sentences, etc.

# Historical Thought ...

- Grammar defined by context-sensitive production rules + transformations
- Semantics defined by mappings:
  - Each grammar rule matches a semantic function
  - Terminal symbols are *referents* or *functions*
  - An environment is (in modern terms) a semantic network of complex interrelationships
  - Meaning is compositional, in terms of the semantic functions
- *Minor* 😊 remaining question: how to represent meaning in the “real world”?

# Very very longstanding interest in clinical NLP:

---

- (1) "the" and "anterior" modify incision
- (2) "the" modifies "crease"
- (3) "the" and "chest" modify "wall"
- (4) "the", "previous", and "radical" modify "mastectomy"
- (5) "made" is dependent upon the main verb "was"
- (6) "along the crease" modifies "made" adverbially
- (7) "against the chest wall" modifies "made" adverbially
- (8) "following the previous radical mastectomy" modifies "made" adverbially

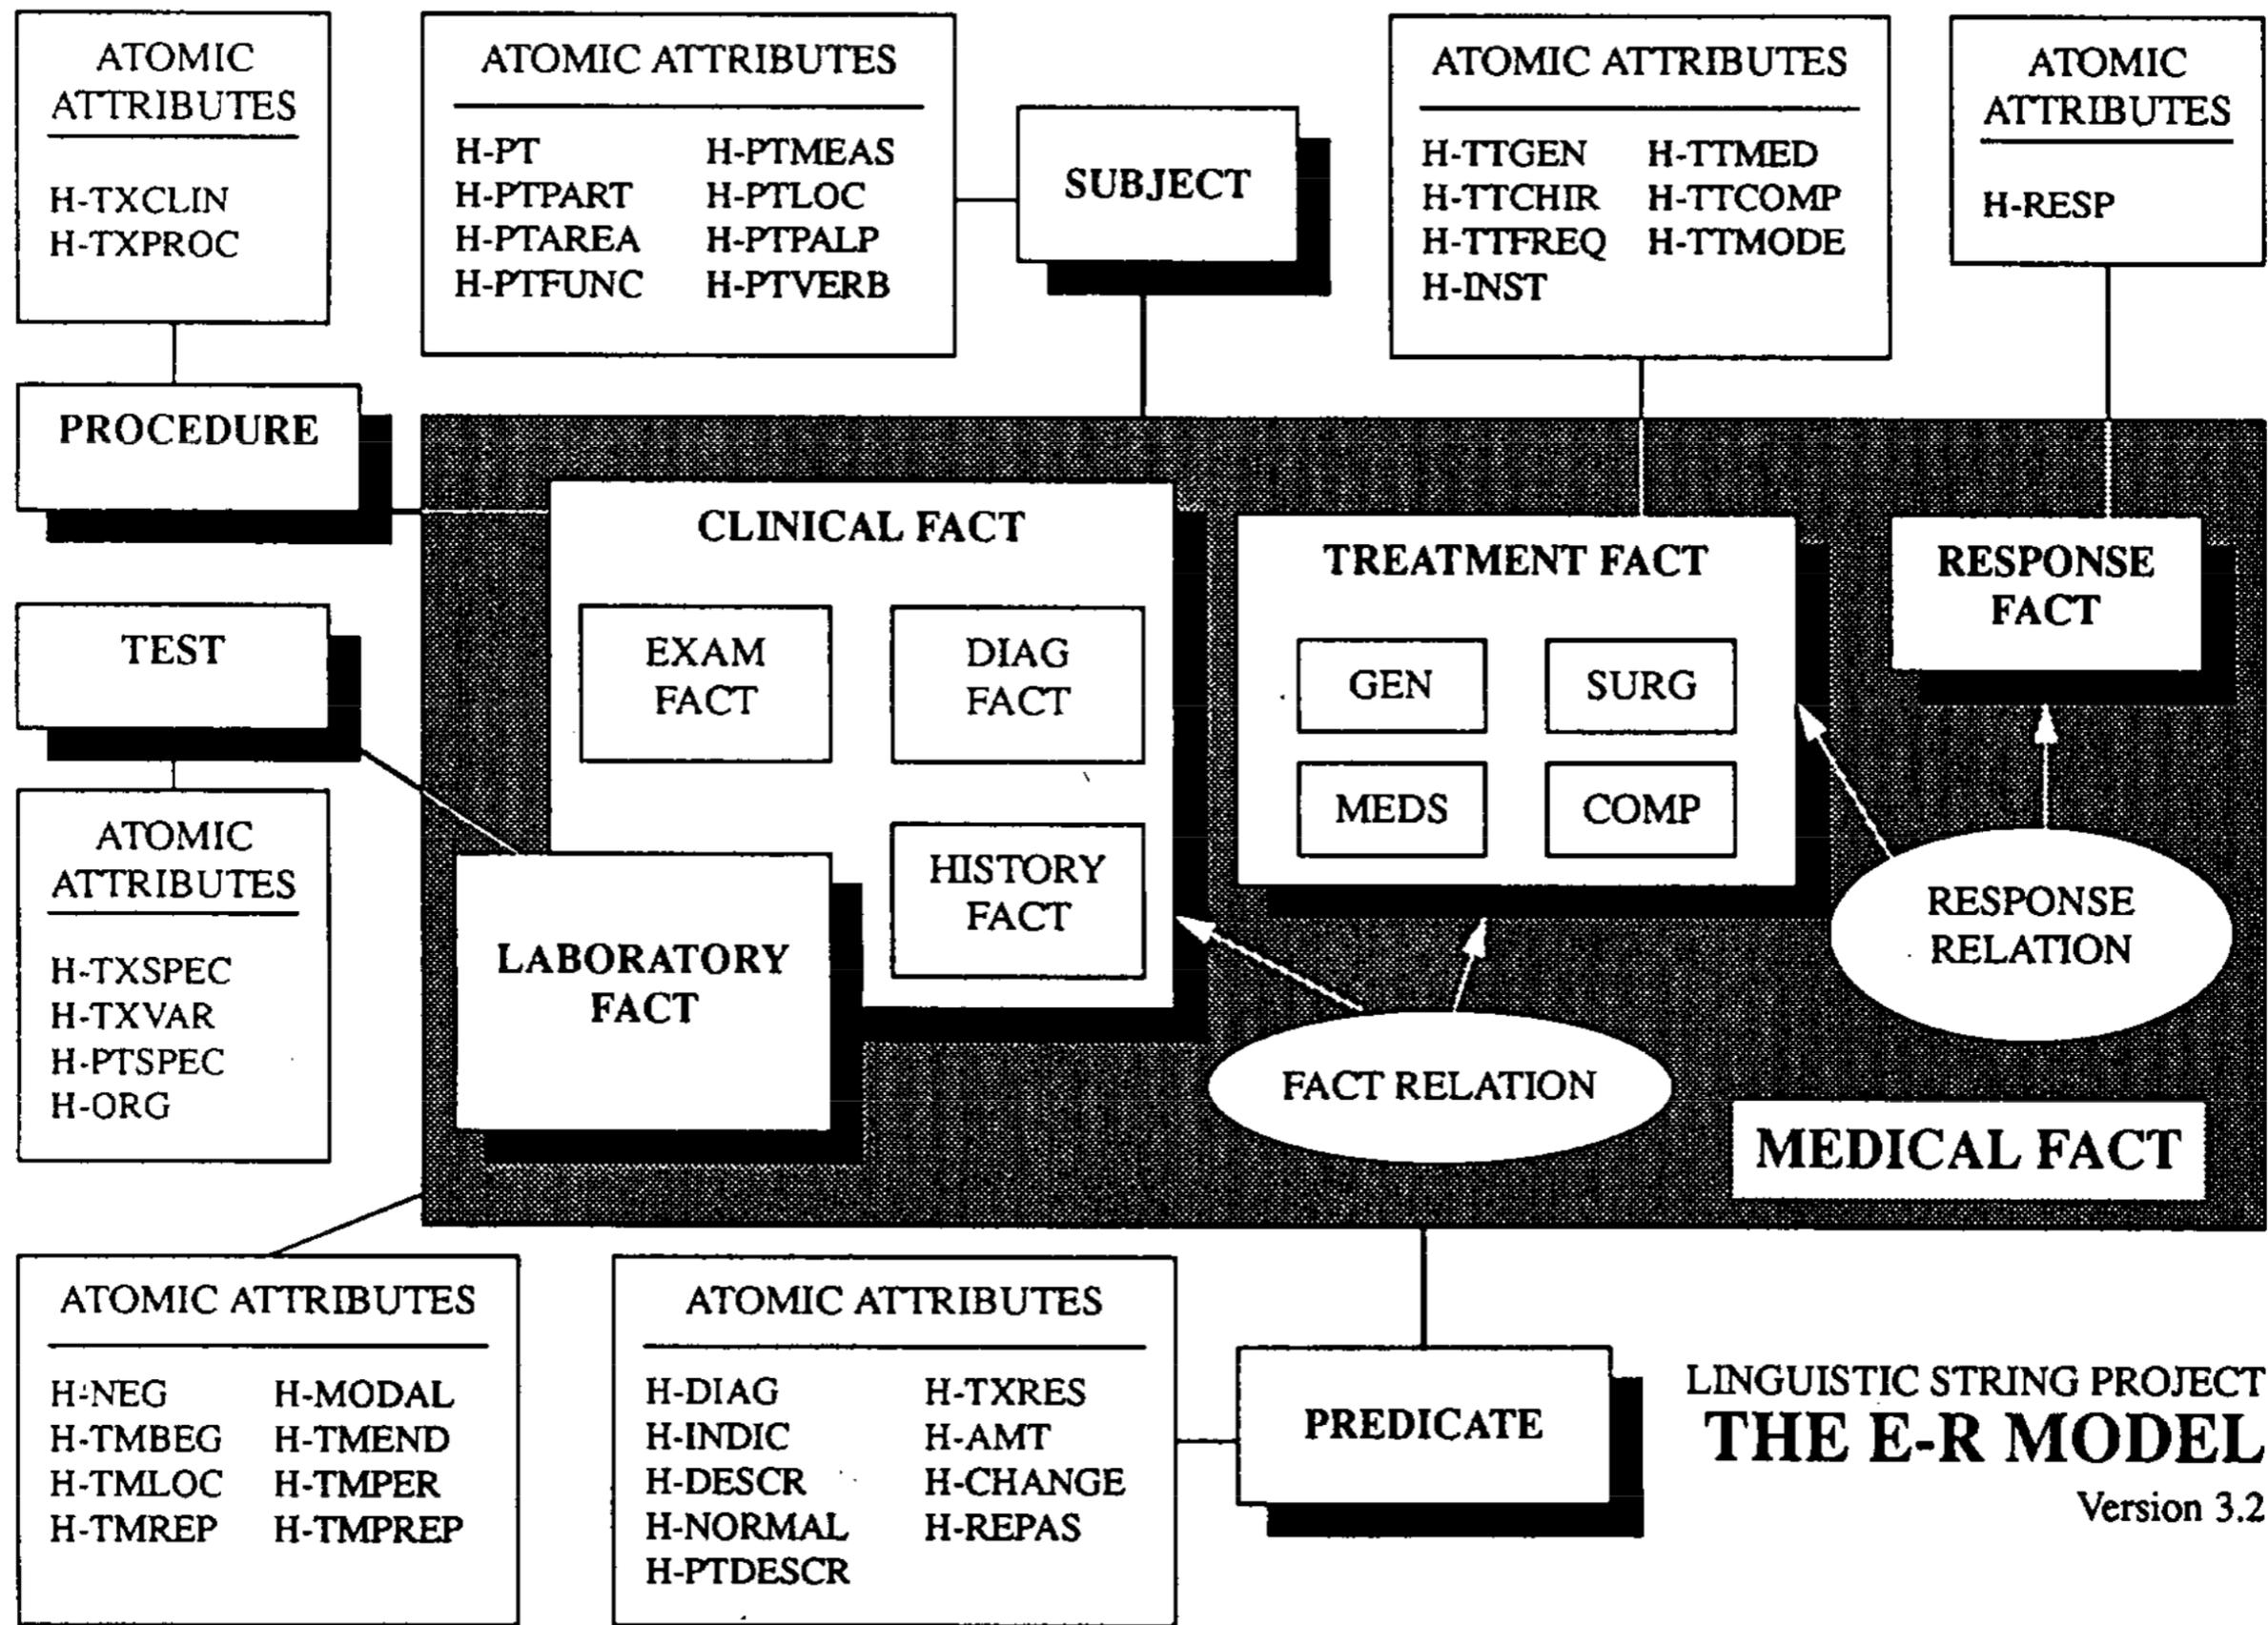

JAMA, March 17, 1969 • Vol 207, No 11

Shapiro, P, et al. *Information in Natural Languages: A New Approach*, JAMA 1969

# Representing Clinical Data

- Medical subclasses in the LSP system based on word co-occurrence patterns seen in patient documents. The subclasses in the connective area are shown only in part.

MEDICAL CLASSES	DESCRIPTION	EXAMPLES IN ENGLISH AND FRENCH
H-PT H-PTAREA H-PTFUNC H-PTLOC H-PTMEAS H-PTPART H-PTPALP H-PTSPEC H-PTVERB	<b>*** PATIENT AREA ***</b> words referring to patient anatomical area physiological function location relation anatomical measure body part palpated body part specimen from patient verb with patient subject	<i>she, le patient, elle, Mme XXX</i> <i>edge, left, surface, rebord, gauche</i> <i>BP, TA, appetite, tonalité, digestif</i> <i>radiating, localisé, irradiant</i> <i>height, size, corpulence, taille</i> <i>arm, liver, bras, foie</i> <i>abdomen, liver, foie</i> <i>blood, sang, urine</i> <i>complains of, se plaint de, subi</i>
H-TXCLIN H-TXPROC H-TXSPEC H-TXVAR	<b>*** TEST / EXAM ***</b> clinical exam, action examination procedure test of specimen test variable	<i>auscultation</i> <i>ultrason, gastroscopie</i> <i>urine analysis</i> <i>glucose, GB, sédiment</i>
H-TTGEN H-TTMED H-TTFREQ H-TTMODE H-TTCHIR H-TTCOMP	<b>*** TREATMENT AREA ***</b> general medical management treatment by medication frequency of medication mode of administration surgical procedures complementary treatments	<i>follow-up, soins, consultation</i> <i>aspirine, clamoxyl</i> <i>bid</i> <i>IM, IV</i> <i>hysterectomy, cholécystectomie</i> <i>bedrest, repos, physiothérapie</i>
H-TMBEG H-TMEND H-TMPER H-TMREP H-TMPREP H-TMLOC	<b>*** TIME AREA ***</b> beginning termination duration repetition time preposition location in time	<i>onset, développe, apparition</i> <i>discontinue, arrêt, stopper</i> <i>persistant, constant</i> <i>habituelle, intermittent</i> <i>during, après, avant, depuis</i> <i>recently, actuelle, déjà, post-op</i>
H-AMT H-BEH H-DIAG H-INDIC H-NORMAL H-ORG H-TXRES H-RESP H-CHANGE	<b>*** RESULT AREA ***</b> amount or degree behavior diagnosis disease indicator word non-problematical organism test/exam result word patient response indication of change	<i>much, totale, sévère, tout à fait</i> <i>works, studies, travaille</i> <i>diabetes mellitus</i> <i>fever, swelling, pain, thrombose</i> <i>within normal limits, bon état, simple</i> <i>staph</i> <i>positif</i> <i>relief</i> <i>augmenté, diminution</i>
H-NEG H-MODAL	<b>*** EVIDENTIAL AREA ***</b> negation of finding uncertainty of finding	<i>no, not, ne pas, jamais</i> <i>evocatrice, probable, suspicion, semble</i>
H-BECONN H-CONN H-SHOW	<b>*** CONNECTIVE AREA ***</b> classifier verb P/V/ADJ/N connects two I-F's V connects test and result	<i>is (a), est (un)</i> <i>due to, secondaire à</i> <i>shows, confirme, montre</i>

**Figure 4** Schematic overview of the types of medical facts seen in patient documents and their associated lexical ("atomic") attributes. The CLINICAL FACT subtypes are distinguished by the paragraph they occur in: EXAM, DIAG, LAB, HISTORY. The TREATMENT FACT type is subdivided into general medical management (GEN), surgery (SURG), medications (MEDS), and all other therapies (COMPLEMENTARY). An instance of a TREATMENT FACT is often coupled to a RESPONSE FACT via a RESPONSE RELATION, e.g. *Much improved on penicillamine 750 mg daily.*

# Formal language semantics

---

- SRI's DIAMOND/DIAGRAM system (~1980)
  - each passage is expressed as a proposition or a conjunction of propositions:
    - a particular procedure for the prevention of hepatitis B could have associated with it the proposition "immunize(GAMMA-GLOBULIN,HEPATITIS-B)"
    - a passage concerned with the etiology of the disease could have the proposition "transmit(TRANSFUSION,HEPATITIS-B)"
    - synonym and hyponym relations
    - ... *a language of primitives for the domain*
- French Remède system
  - “medical documentary language using current medical terms and few syntactic rules”
  - taught to doctors to write notes
  - ... *not popular*

Walker, D. E., Hobbs, J. R., 1981. Natural Language Access to Medical Text\*. (pp. 269–273). Presented at the Proc Annu Symp Comput Appl Med Care.

de Heulme M, Tainturier C, Thomas D. [Computer treatment of medical reports: example of the "Remède" system (author's transl)]. *Nouv Presse Med*. 1979 Oct 22;8(40):3223-6. French. PubMed PMID: 534182

# Outline

---

- Value of the data in clinical text
- Hyper-simplified linguistics
- **Term spotting + handling negation, uncertainty**
- ML to expand terms
- pre-NN ML to identify entities and relations
- language models
- vector space embeddings based on co-occurrence
- adding context to help with disambiguation
- from embedding single words to phrases, sentences, etc.

# Term Spotting

- Traditionally, lists of coded items, narrative terms and patterns hand-crafted by researcher
  - E.g., N3C (National Covid Cohort Collaborative)
    - Institutions don't want to share notes, even de-identified
    - Lack of sophistication at most medical centers to run sophisticated tools
    - Instead, run simple term matching algorithms and report just terms
- Negation and uncertainty handled by somewhat ad-hoc methods
  - NegEx is widely used, ∃ many more sophisticated variants
- Generalize terms to get better coverage
  - Manually or automatically identify high-certainty “anchors”
  - Learn related terms to augment the set of terms
    - From knowledge bases such as UMLS
    - From co-occurrence in EMR data
    - From co-occurrence in publications

COVID symptoms
• Fever
• Chill
• Cough
• Fatigue
• Nasal obstruction
• Loss of appetite
• Diarrhea
• Abdominal pain
• Nausea
• Vomiting
• Sore throat
• Headache
• Myalgia
• Loss of taste
• Loss of smell
• Dyspnea
• Chest pain
• Delirium
• Hypersomnia
• Cyanosis

anosmia  
(C0003126)

# Negation

---

- “Identifying pertinent negatives, then, involves identifying a proposition ascribing a clinical condition to a person and determining whether the proposition is denied or negated in the text.”
- Simpler than general problem of negation in NLP because negation applies mostly to noun phrases indicating diseases, tests, drugs, findings, ...
- NegEx
  - Find all UMLS terms in each sentence of a discharge summary
    - “The patient denied experiencing chest pain on exertion” ⇒  
“The patient denied experiencing [?]S1459038[?] on exertion”
  - Find patterns
    - <negation phrase>  $\ast\{0,5\}$  <UMLS term>
      - "no signs of", "ruled out unlikely", "absence of", "not demonstrated", "denies", "no sign of", "no evidence of", "no", "denied", "without", "negative for", "not", "doubt", "versus"
    - <UMLS term>  $\ast\{0,5\}$  <negation phrase>
      - “declined”, “unlikely”
  - Pseudo-negation: "gram negative", "no further", "not able to be", "not certain if", "not certain whether", "not necessarily", "not rule out", "without any further", "without difficulty", "without further”

# NegEx results

---

- Baseline:
  - <negation phrase> \* <UMLS term>
    - "no", "denies", "not", "without", "\*n't", "ruled out", "denied"

	Baseline			NegEx		
	Group 1 sentences (i.e. containing NegEx negation phrases)	Group 2 sentences (i.e., not containing NegEx negation phrases)	All sentences	Group 1 sentences (i.e. containing NegEx negation phrases)	Group 2 sentences (i.e., not containing NegEx negation phrases)	All sentences
n	500	500	1000	500	500	1000
Sensitivity	88.27	0.00	<b>88.27</b>	82.31	0.00	77.84
Specificity	52.69	100.00	85.27	82.50	100.00	<b>94.51</b>
PPV	68.42	—	68.42	84.49	—	<b>84.49</b>
NPV	79.46	96.99	<b>93.01</b>	80.21	96.99	91.73

- Extremely simplistic schemes (kind of) work

# Outline

---

- Value of the data in clinical text
- Hyper-simplified linguistics
- Term spotting + handling negation, uncertainty
- **ML to expand terms**
- pre-NN ML to identify entities and relations
- language models
- vector space embeddings based on co-occurrence
- adding context to help with disambiguation
- from embedding single words to phrases, sentences, etc.

# Generalize Terms

---

- Use synonymous terms as well as the starting ones
- Take advantage of others related terms
  - hypo- or hypernyms
  - other associated terms
    - e.g., common symptoms or treatments of a disease
- Recursive ML problem: learn how best to identify cases associated with a term
  - “phenotyping”
- “Anchor & Learn”-like methods learn secondary terms from
  - medical records
  - textbooks and on-line medical resources
  - Pubmed abstracts and articles

# Available Classification Thesauri

## Most Available through UMLS

---

- Unified Medical Language Systems project of NLM; since ~1985
- *Metathesaurus* now (2022ab version) includes 182 source vocabularies
  - (had 215, but some obsolete ones were dropped)
  - MeSH, SNOMED, ICD-9, ICD-10, LOINC, RxNORM, NCI, CPT, GO, DXPLAIN, OMIM, ...
- Synonym mappings across vocabularies;
  - e.g., “heart attack” = “acute myocardial infarct” = “myocardial infarction” ...
  - 4,662,313 distinct concepts, represented by concept unique identifier (CUI)
- Jumbled compendium of every hierarchy drawn from every source
- *Semantic Network*
  - Hierarchy of
    - 54 relations
    - 127 types
  - Every CUI is assigned  $\geq 1$  semantic type
    - 1: 4,348,619
    - 2: 295,734
    - 3: 17,895
    - 4: 65 (most are allergens — e.g., Pharmacologic Substance; Amino Acid, Peptide, or Protein; Immunologic Factor; Indicator, Reagent, or Diagnostic Aid)

# MetaMap

---

- NLM-developed UMLS matcher for narrative text
  - Very thorough, but hard to use because it over-generates
    - “Mr. Blind is a 79-year-old white white male with a history of diabetes mellitus, inferior myocardial infarction, who underwent open repair of his increased diverticulum November 13th at Sephsandpot Center.”
    - E.g., “Mr.” ⇒
      - 1000 MR (Magnetic Resonance Imaging) [Diagnostic Procedure]
      - 1000 MR (MRC1 gene) [Gene or Genome]
      - 1000 Mr. (Mr. - Title) [Conceptual Entity]
      - 1000 MR (NR3C2 protein, human) [Amino Acid, Peptide, or Protein, Receptor]
      - 1000 MR (Minor Response) [Finding]
      - 1000 MR (Minimal Response) [Finding]
      - 1000 MR (RECIL MR) [Finding]

Mr. Blind is a 79-year-old white white male with a history of diabetes mellitus, inferior myocardial infarction, who underwent open repair of his increased diverticulum November 13th at Sephsandpot Center.

Admission Date: 2011-10-06 Discharge Date: 2011-10-17

Date of Birth: 1935-03-29 Sex: M

Service: Medicine

**CHIEF COMPLAINT:** Admitted from rehabilitation for hypotension (systolic blood pressure to the 70s) and decreased urine output.

**HISTORY OF PRESENT ILLNESS:** The patient is a 76-year-old male who had been hospitalized at the Brookside Hospital from 09-27 through 10-05 after undergoing a left femoral-AT bypass graft and was subsequently discharged to a rehabilitation facility.

On 2011-10-06, he presented again to the Brookside Hospital after being found to have blood pressure in the 70s and no urine output for 17 hours. A Foley catheter placed at the rehabilitation facility yielded 100 cc of murky/brown urine. There may also have been purulent discharge at the penile meatus at this time.

On presentation to the Emergency Department, the patient was without subjective complaints. In the Emergency Department, he was found to have systolic blood pressure of 85. He was given 6 liters of intravenous fluids and transiently started on dopamine for a systolic blood pressure in the 80.s

**PAST MEDICAL HISTORY:**

# Study of 3-letter abbreviations in Medline (Pubmed) abstracts

---

- Extraction method examples:
  - *minimum alveolar anesthetic concentration* (MAC)
  - *procoagulant activity* (PCA)
  - *carboxymethyllysine* (CML)
  - *n-6-(delta-2-isopentenyl) adenine* (IPA)
  - + MetaMap-based heuristics
- 81.2% were ambiguous, with mean of 16.6 senses
- ignoring rare (<5) occurrences, 64.6% were ambiguous, with 4.91 senses
  - —long tail
- 82.8% of abbreviations with  $\geq 100$  occurrences are in UMLS
  - but only 23.5% of all abbreviations

# Outline

---

- Value of the data in clinical text
- Hyper-simplified linguistics
- Term spotting + handling negation, uncertainty
- ML to expand terms
- **pre-NN ML to identify entities and relations**
- language models
- vector space embeddings based on co-occurrence
- adding context to help with disambiguation
- from embedding single words to phrases, sentences, etc.

# The Importance of Context

---

- “Mr. **Huntington** was treated for **Huntington’s** Disease at **Huntington** Hospital, located on **Huntington** Avenue.”
  - Huntington
  - Huntington’s Disease
  - Mr. Huntington’s Disease
- “Atenolol was **administered** to Mr. Huntington.”
  - vs. “Atenolol was **considered** for control of heart rate.”
  - vs. “Atenolol was **ineffective** and therefore **discontinued**.”

# Building Feature-Based Models

---

- Features of text from which models can be built
  - words, parts of speech, capitalization, punctuation
  - document section, conventional document structures
  - identified patterns and thesaurus terms
  - lexical context
    - ➔ all of the above, for n-tuples of words surrounding target
  - syntactic context
    - ➔ all of the above, for words syntactically related to target
    - E.g., “The lasix, started yesterday, reduced ascites ...”

```
+-----Xp-----+
|               +-----Ss-----+
|               +----MXsp----+----Xc-----+
+----Wd----+   +--Xd--+---MVpn---+   |   +-----Os-----+
|           |   |       |           |   |   |           |
LEFT-WALL lasix[?].n , started.v-d yesterday , reduced.v-d ascites[?].n .
```

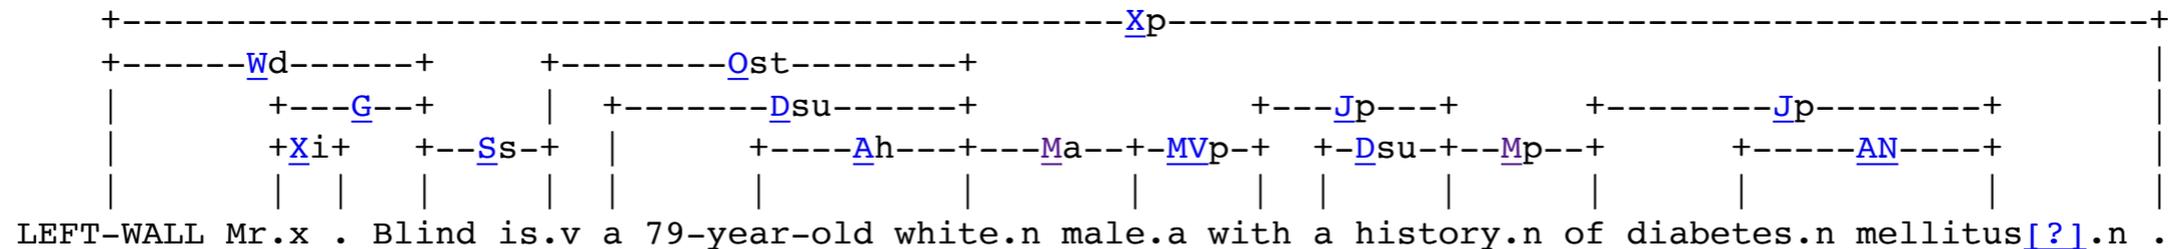

(Output from Link Grammar Parser, w/o special medical dictionary)

Uzuner, Ö., Sibanda, T. C., Luo, Y., & Szolovits, P. (2008). A de-identifier for medical discharge summaries. *Artificial Intelligence in Medicine*, 42(1), 13–35. <http://doi.org/10.1016/j.artmed.2007.10.001>

# Parsing Can be Ambiguous

- Prepositional phrase attachment
- Part of speech
  - e.g., white.n vs. white.a
- Hope that there is enough redundancy to overcome such limitations

Found 111 linkages (24 with no P.P. violations)

# Learning Models

---

- Given a target classification, build a machine learning model predicting that class
  - support vector machines (SVM)
  - classification trees
  - naive Bayes or Bayesian networks
  - artificial neural networks
  - ...
- $\text{class}(\text{word}) = \text{function}(\text{feature}_1, \text{feature}_2, \text{feature}_3, \dots)$ 
  - sometimes, astronomically large (binary) feature set; SVM can deal with it
    - $f_1 \dots f_{100,000}$ : whether the word is “a”, “aback”, “abacus”, ..., “zymotic”
    - $f_{100,001} \dots$ : whether word’s POS is “noun”, “verb”, “adj”, ...
    - $f_{100,100} \dots$ : whether the word maps to CUI “C0000001”, “C0000002”, ...
    - $f_{3,000,000} \dots$ : same as above, but for 1<sup>st</sup>, 2<sup>nd</sup>, 3<sup>rd</sup> word to right/left
    - $f_{6,000,000} \dots$ : {lp-link, word} for 1<sup>st</sup>, 2<sup>nd</sup>, 3<sup>rd</sup> link in parse to right/left
    - ...

# Using this model for de-identification

**Table 6** Evaluation on authentic discharge summaries

Method	Class	Precision (%)	Recall (%)	F-measure (%)
Stat De-id	PHI	98.46	95.24	<b>96.82</b>

Stat De-id	Non-PHI	99.90	99.98	<b>99.94</b>
SNoW	Non-PHI	99.86	99.95	99.90 *

The F-measure differences from Stat De-id in PHI and in non-PHI are significant at  $\alpha = 0.05$ .

Uzuner, Ö., Sibanda, T. C., Luo, Y., & Szolovits, P. (2008). A de-identifier for medical discharge summaries. *Artificial Intelligence in Medicine*, 42(1), 13–35. <http://doi.org/10.1016/j.artmed.2007.10.001>

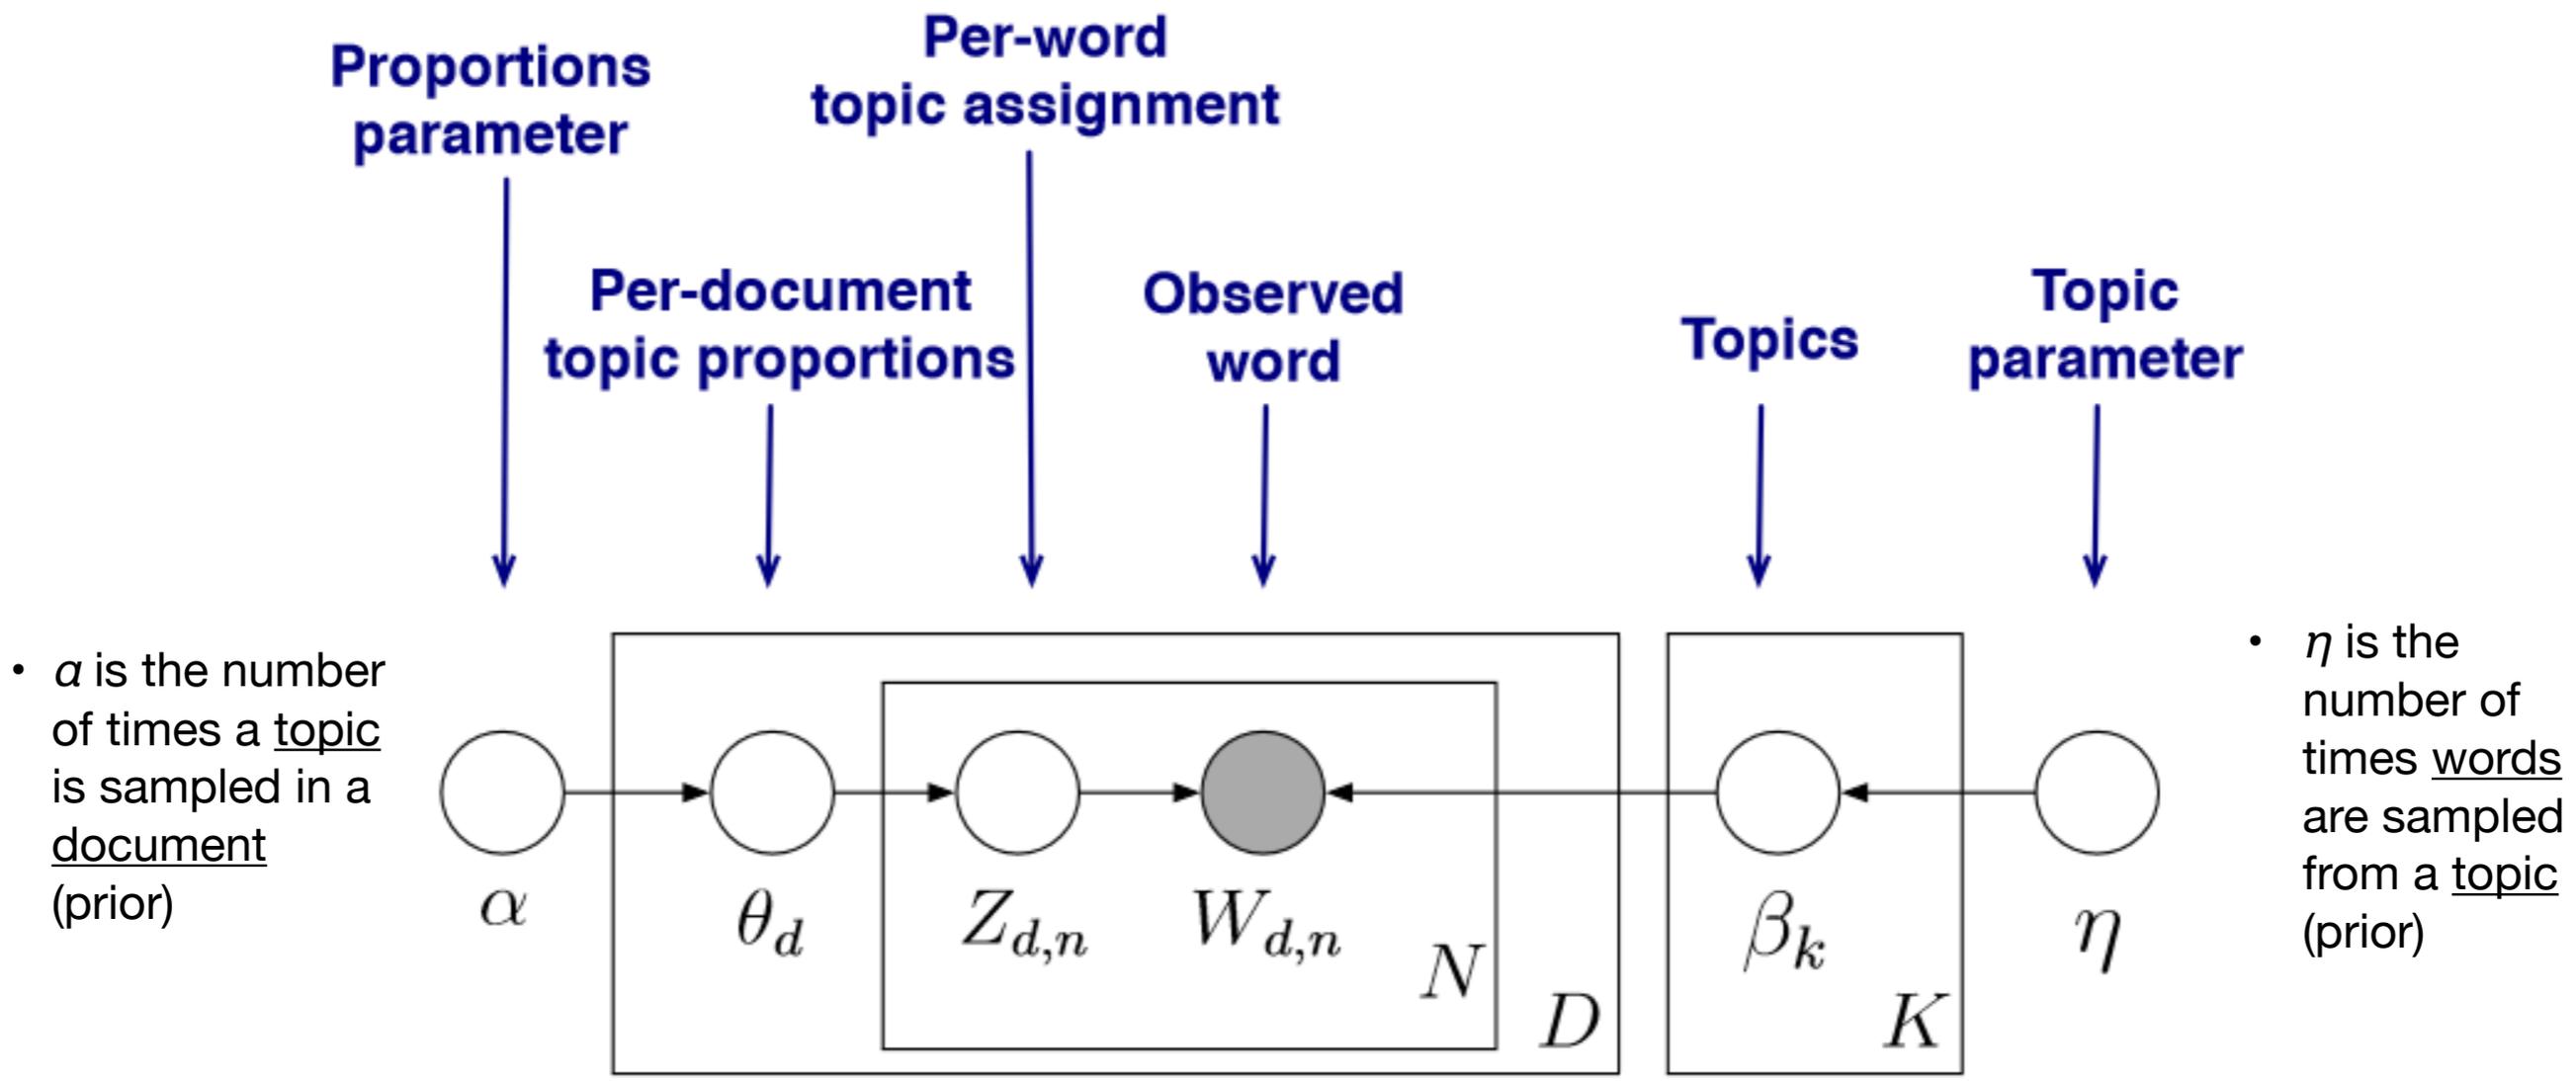

# Intuition: Documents are made of Topics

- Every document is a mixture of topics
- Every topic is a distribution over words
- Every word is a draw from a topic

# LDA – Latent Dirichlet Allocation

- We observe words, we infer everything else, with our assumed structure

•  $\alpha$  is the number of times a topic is sampled in a document (prior)

•  $\eta$  is the number of times words are sampled from a topic (prior)

$$\prod_{i=1}^K p(\beta_i | \eta) \prod_{d=1}^D p(\theta_d | \alpha) \left( \prod_{n=1}^N p(z_{d,n} | \theta_d) p(w_{d,n} | \beta_{1:K}, z_{d,n}) \right)$$

# Predicting early psychiatric readmission by LDA

---

- Can we predict 30-day psych readmission?
- Cohort: patients admitted to a psych inpatient ward between 1994-2012 with a principal diagnosis of major depression
  - 470 of 4687 were readmitted within 30 days with a psych diagnosis; 2977 additionally were readmitted in 30 days with other diagnoses; 1240 not readmitted
- Compare predictive models built using SVM from
  - baseline clinical features (AUC = .62)
    - age, gender, public health insurance, Charlson comorbidity index
  - + common words from notes (AUC = .65–.68)
    - 1–1000 most informative words per patient, by TF-IDF
    - top-1 used 3013 unique words, top-10 used 18 173, top-1000 use almost entire vocabulary (66 429/66 451 words)
  - + 75 topics from LDA on notes (AUC = .78)

**Table 2.** Example topics for MDD patients readmitted with a psychiatric diagnosis within 30 days

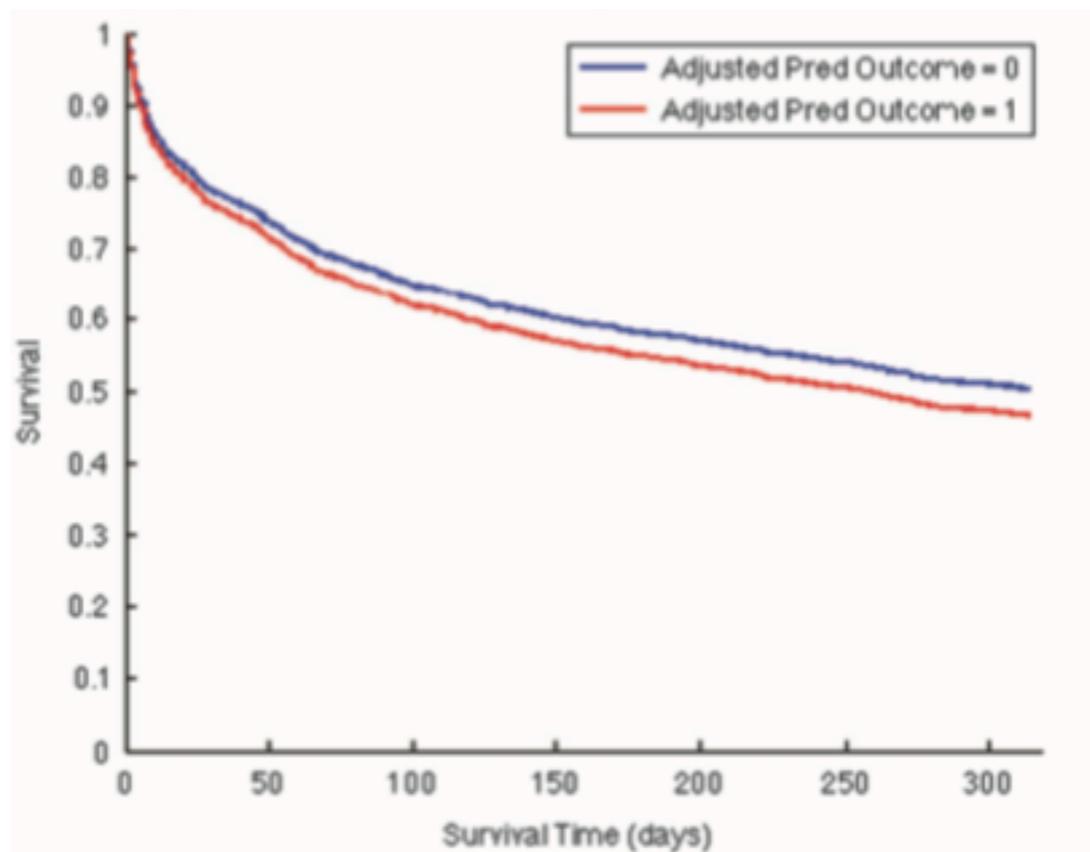

<i>Terms</i>	<i>Topic annotation</i>
*patient alcohol withdrawal depression drinking end ativan etoh drinks medications clinic inpatient diagnosis days hospital < substance use treatment program name > use abuse problem number	Alcohol

Abbreviations: AUC, area under the curve; LDA, Latent Dirichlet Allocation.

**Figure 1.** Kaplan–Meier survival curve for time to psychiatric hospital readmission, for a model built using baseline sociodemographic and clinical variables only. Patients are plotted separately for two groups identified by the support vector machine model as: (1) likely psychiatric readmissions in red; and (2) unlikely psychiatric readmissions in blue.

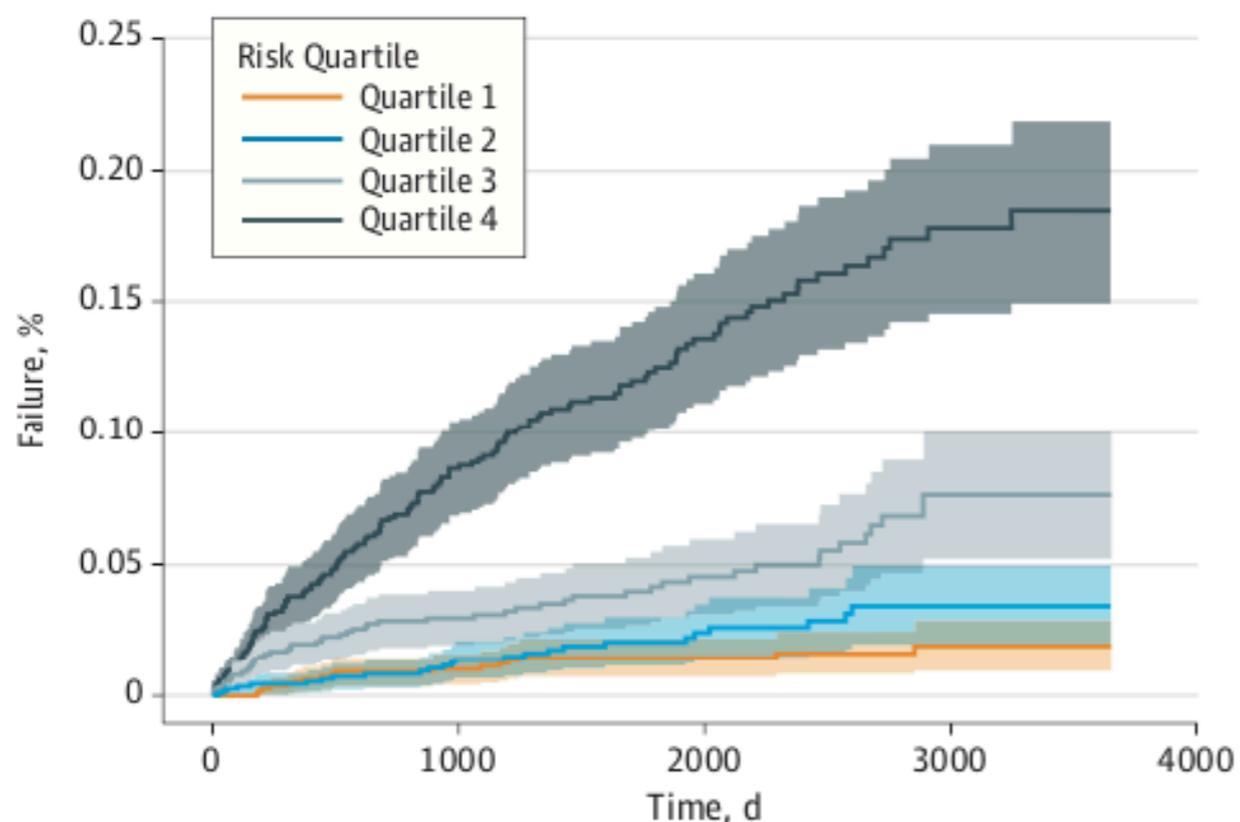

**Figure 2.** Kaplan–Meier survival curve for time to psychiatric hospital readmission, for a model built using the baseline variables and 75 topics. Patients are plotted separately for two groups identified by the support vector machine model as: (1) likely psychiatric readmissions in red; and (2) unlikely psychiatric readmissions in blue.

# Prediction of Suicide and Accidental Death After Discharge

---

- Very large cohort: 845 417 discharges from two medical centers, 2005–2013
  - 458 053 unique individuals
- Imbalanced: 235 suicides, but all-cause mortality was 18% during 9 years
- Censoring: median follow-up was 5.2 years
- “Positive Valence” assessed using *curated list of 3000 terms* found in discharge summaries
  - “Valence, as used in psychology, especially in discussing emotions, means the intrinsic attractiveness/"good"-ness (positive valence) or averseness/"bad"-ness (negative valence) of an event, object, or situation.[1] The term also characterizes and categorizes specific emotions. For example, emotions popularly referred to as "negative", such as anger and fear, have negative valence. Joy has positive valence.” —Wikipedia

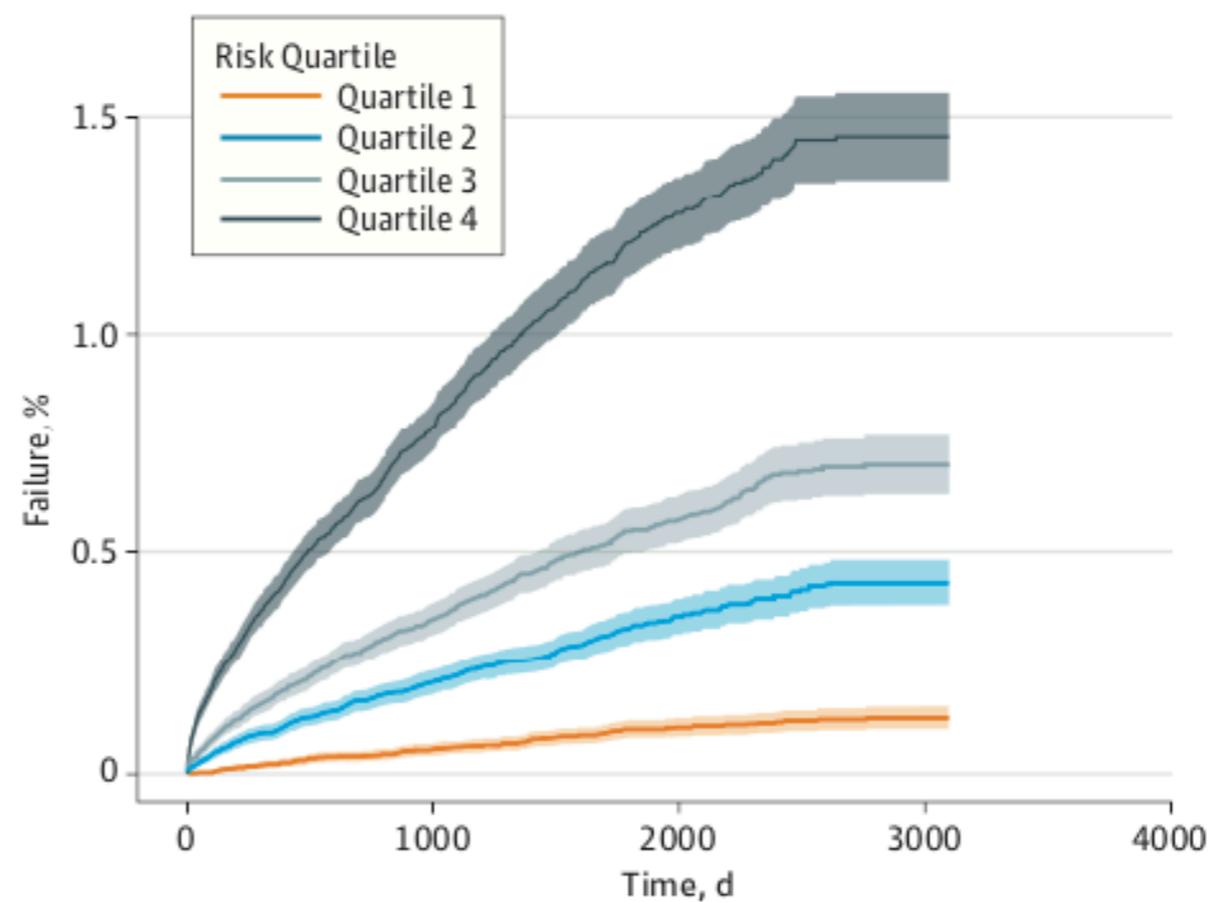

Figure 1. Kaplan-Meier Curves for Time to Death by Suicide Among 458 053 Individuals With at Least 1 Hospital Discharge by Predicted Risk Quartile

No. at risk				
Quartile 1	114 514	93 698	63 289	31 025
Quartile 2	114 513	85 693	52 292	22 697
Quartile 3	114 513	82 810	49 258	21 580
Quartile 4	114 513	85 746	51 707	21 541

The axes are rescaled inside the figure to improve interpretability.

Figure 2. Kaplan-Meier Curves for Time to Death by Suicide or Accidental Death Among 458 053 Individuals With at Least 1 Hospital Discharge by Predicted Risk Quartile

No. at risk				
Quartile 1	114 514	99 448	68 260	33 935
Quartile 2	114 513	89 270	55 871	25 263
Quartile 3	114 513	84 465	50 944	21 768
Quartile 4	114 513	74 764	41 471	15 877

The axes are rescaled inside the figure to improve interpretability.

# Outline

---

- Value of the data in clinical text
- Hyper-simplified linguistics
- Term spotting + handling negation, uncertainty
- ML to expand terms
- pre-NN ML to identify entities and relations
- **language models**
- vector space embeddings based on co-occurrence
- adding context to help with disambiguation
- from embedding single words to phrases, sentences, etc.

# Language Modeling

---

- Predict the next token given the ones before it
  - In unigram model,  $P(\text{token})$  is just estimated from frequency in corpus
- Markov assumption simplifies model so
  - $P(\text{token} \mid \text{stuff before}) = P(\text{token} \mid \text{previous token})$  [bigram model]
  - $P(t_k \mid \text{stuff before}) = P(t_k \mid t_{k-1}, \dots, t_{k-n})$  [n-gram models]
- Perplexity is an aggregate measure of the complexity of a corpus
  - $2^{H(p)}$  where  $H(p)$  is the entropy of the probability distribution
  - intuitively, the number of likely ways to continue a text
    - a perplexity of  $k$  means that you are as surprised on average as you would have been if you had to guess between  $k$  equiprobable choices at each step
- For example, we compared perplexity of dictated doctors' notes (8.8) vs. that of doctor-patient conversations (73.1)
  - What does that tell you about the difficulty of accurately transcribing speech for these applications?

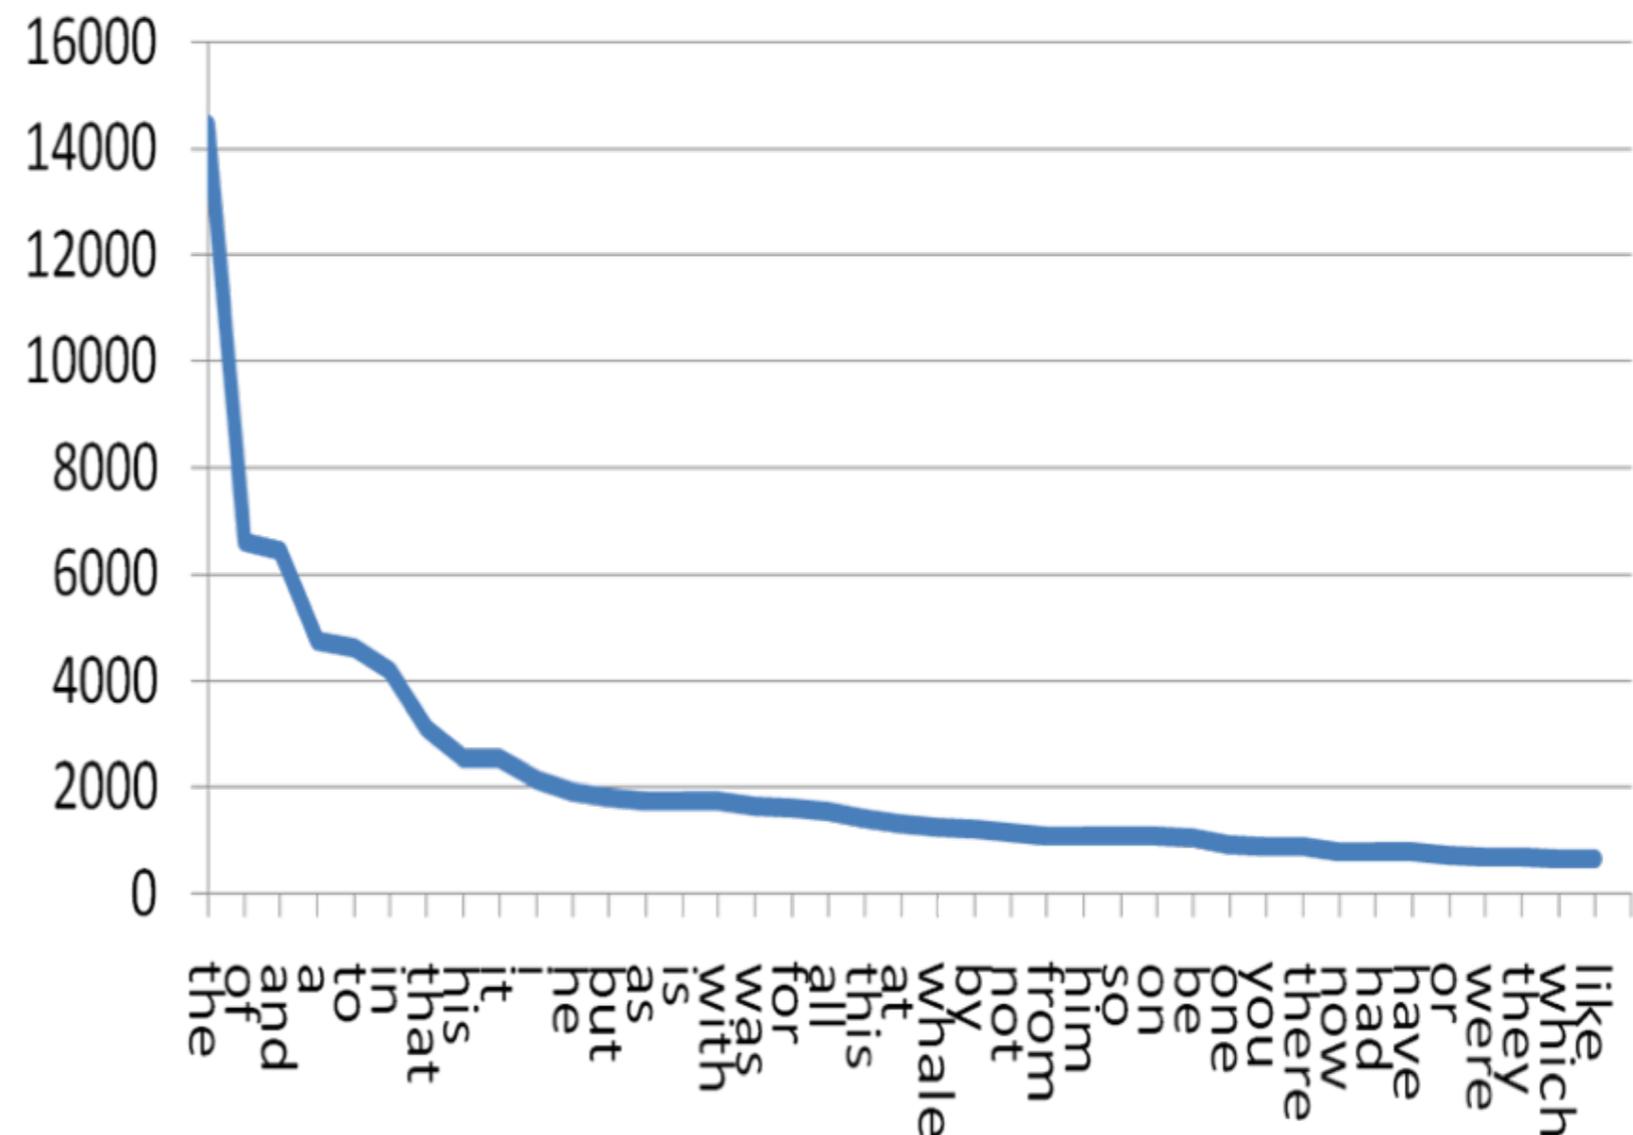

# Statistical Models of Language

## Zipf's law

---

- There are very few very frequent words
- Most words have very low frequencies
- The frequency of a word is inversely proportional to its rank
- In the Brown corpus, the 10 top-ranked words make up 23% of total corpus size (Baroni, 2007)

•

# N-gram models

---

- Shakespeare as a Corpus
  - $N=884,647$  tokens,  $V=29,066$
  - Shakespeare produced 300,000 bigram types out of  $V^2= 844$  million possible bigrams...
    - So, 99.96% of the possible bigrams were never seen
- Google released corpus of 1,024,980,267,229 (i.e., ~1T) words in 2006
  - 13.6M unique words occurring at least 200 times
  - 1.2B five-word sequences that occur at least 40 times

Number of tokens:	1,024,908,267,229
Number of sentences:	95,119,665,584
Number of unigrams:	13,588,391
Number of bigrams:	314,843,401
Number of trigrams:	977,069,902
Number of fourgrams:	1,313,818,354
Number of fivegrams:	1,176,470,663

# Generating Sequences

---

- This model can be turned around to generate random sentences that are like the sentences from which the model was derived.
- Generally attributed to Claude Shannon.
  - Sample a random bigram ( $\langle s \rangle$ ,  $w$ ) according to its probability
  - Now sample a random bigram ( $w$ ,  $x$ ) according to its probability
  - Where the prefix  $w$  matches the suffix of the first.
  - And so on until we randomly choose a ( $y$ ,  $\langle /s \rangle$ )
- Then string the words together

```
<s> I
    I want
      want to
        to get
          get Chinese
            Chinese food
              food </s>
```

# Generating Shakespeare

$$\text{vec}(\text{"man"}) - \text{vec}(\text{"king"}) + \text{vec}(\text{"woman"}) = \text{vec}(\text{"queen"})$$

# t-Distributed Stochastic Neighbor Embedding

---

# Feature extraction for phenotyping from semantic and knowledge resources (SEDFE)

- Goal: “fully automated and robust unsupervised feature selection method that leverages only publicly available medical knowledge sources, instead of EHR data”
  - Surrogate features derived from knowledge sources
- Method:
  - Build a word2vec skipgram model from .5M Springer articles (2006-08) to yield 500-D vectors for each word
  - Sum vectors for each word in the defining strings for UMLS Concepts, weighted by IDF
  - For each disease in Wikipedia, Medscape eMedicine, Merck Manuals Professional Edition, Mayo Clinic Diseases and Conditions, and MedlinePlus Medical Encyclopedia use NER to find all concepts related to the phenotype
  - Retain only concepts that occur in at least 3 of 5 knowledge sources
  - Choose top  $k$  concepts whose embedding vectors are closest (by cos distance) to the embedding of the phenotype
  - Define the phenotype as a linear combination of its related concepts, learn weights by least squares, and choose  $k$  to minimize BIC

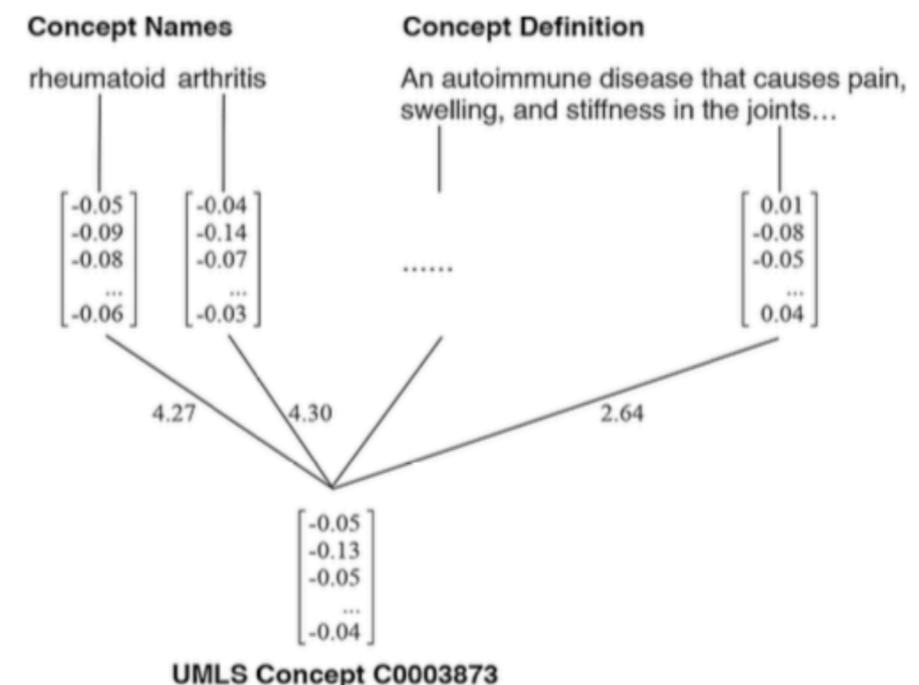

Fig. 1. Generating concept vector representations from word vectors in the paraphrase.

# Evaluating SEDFE

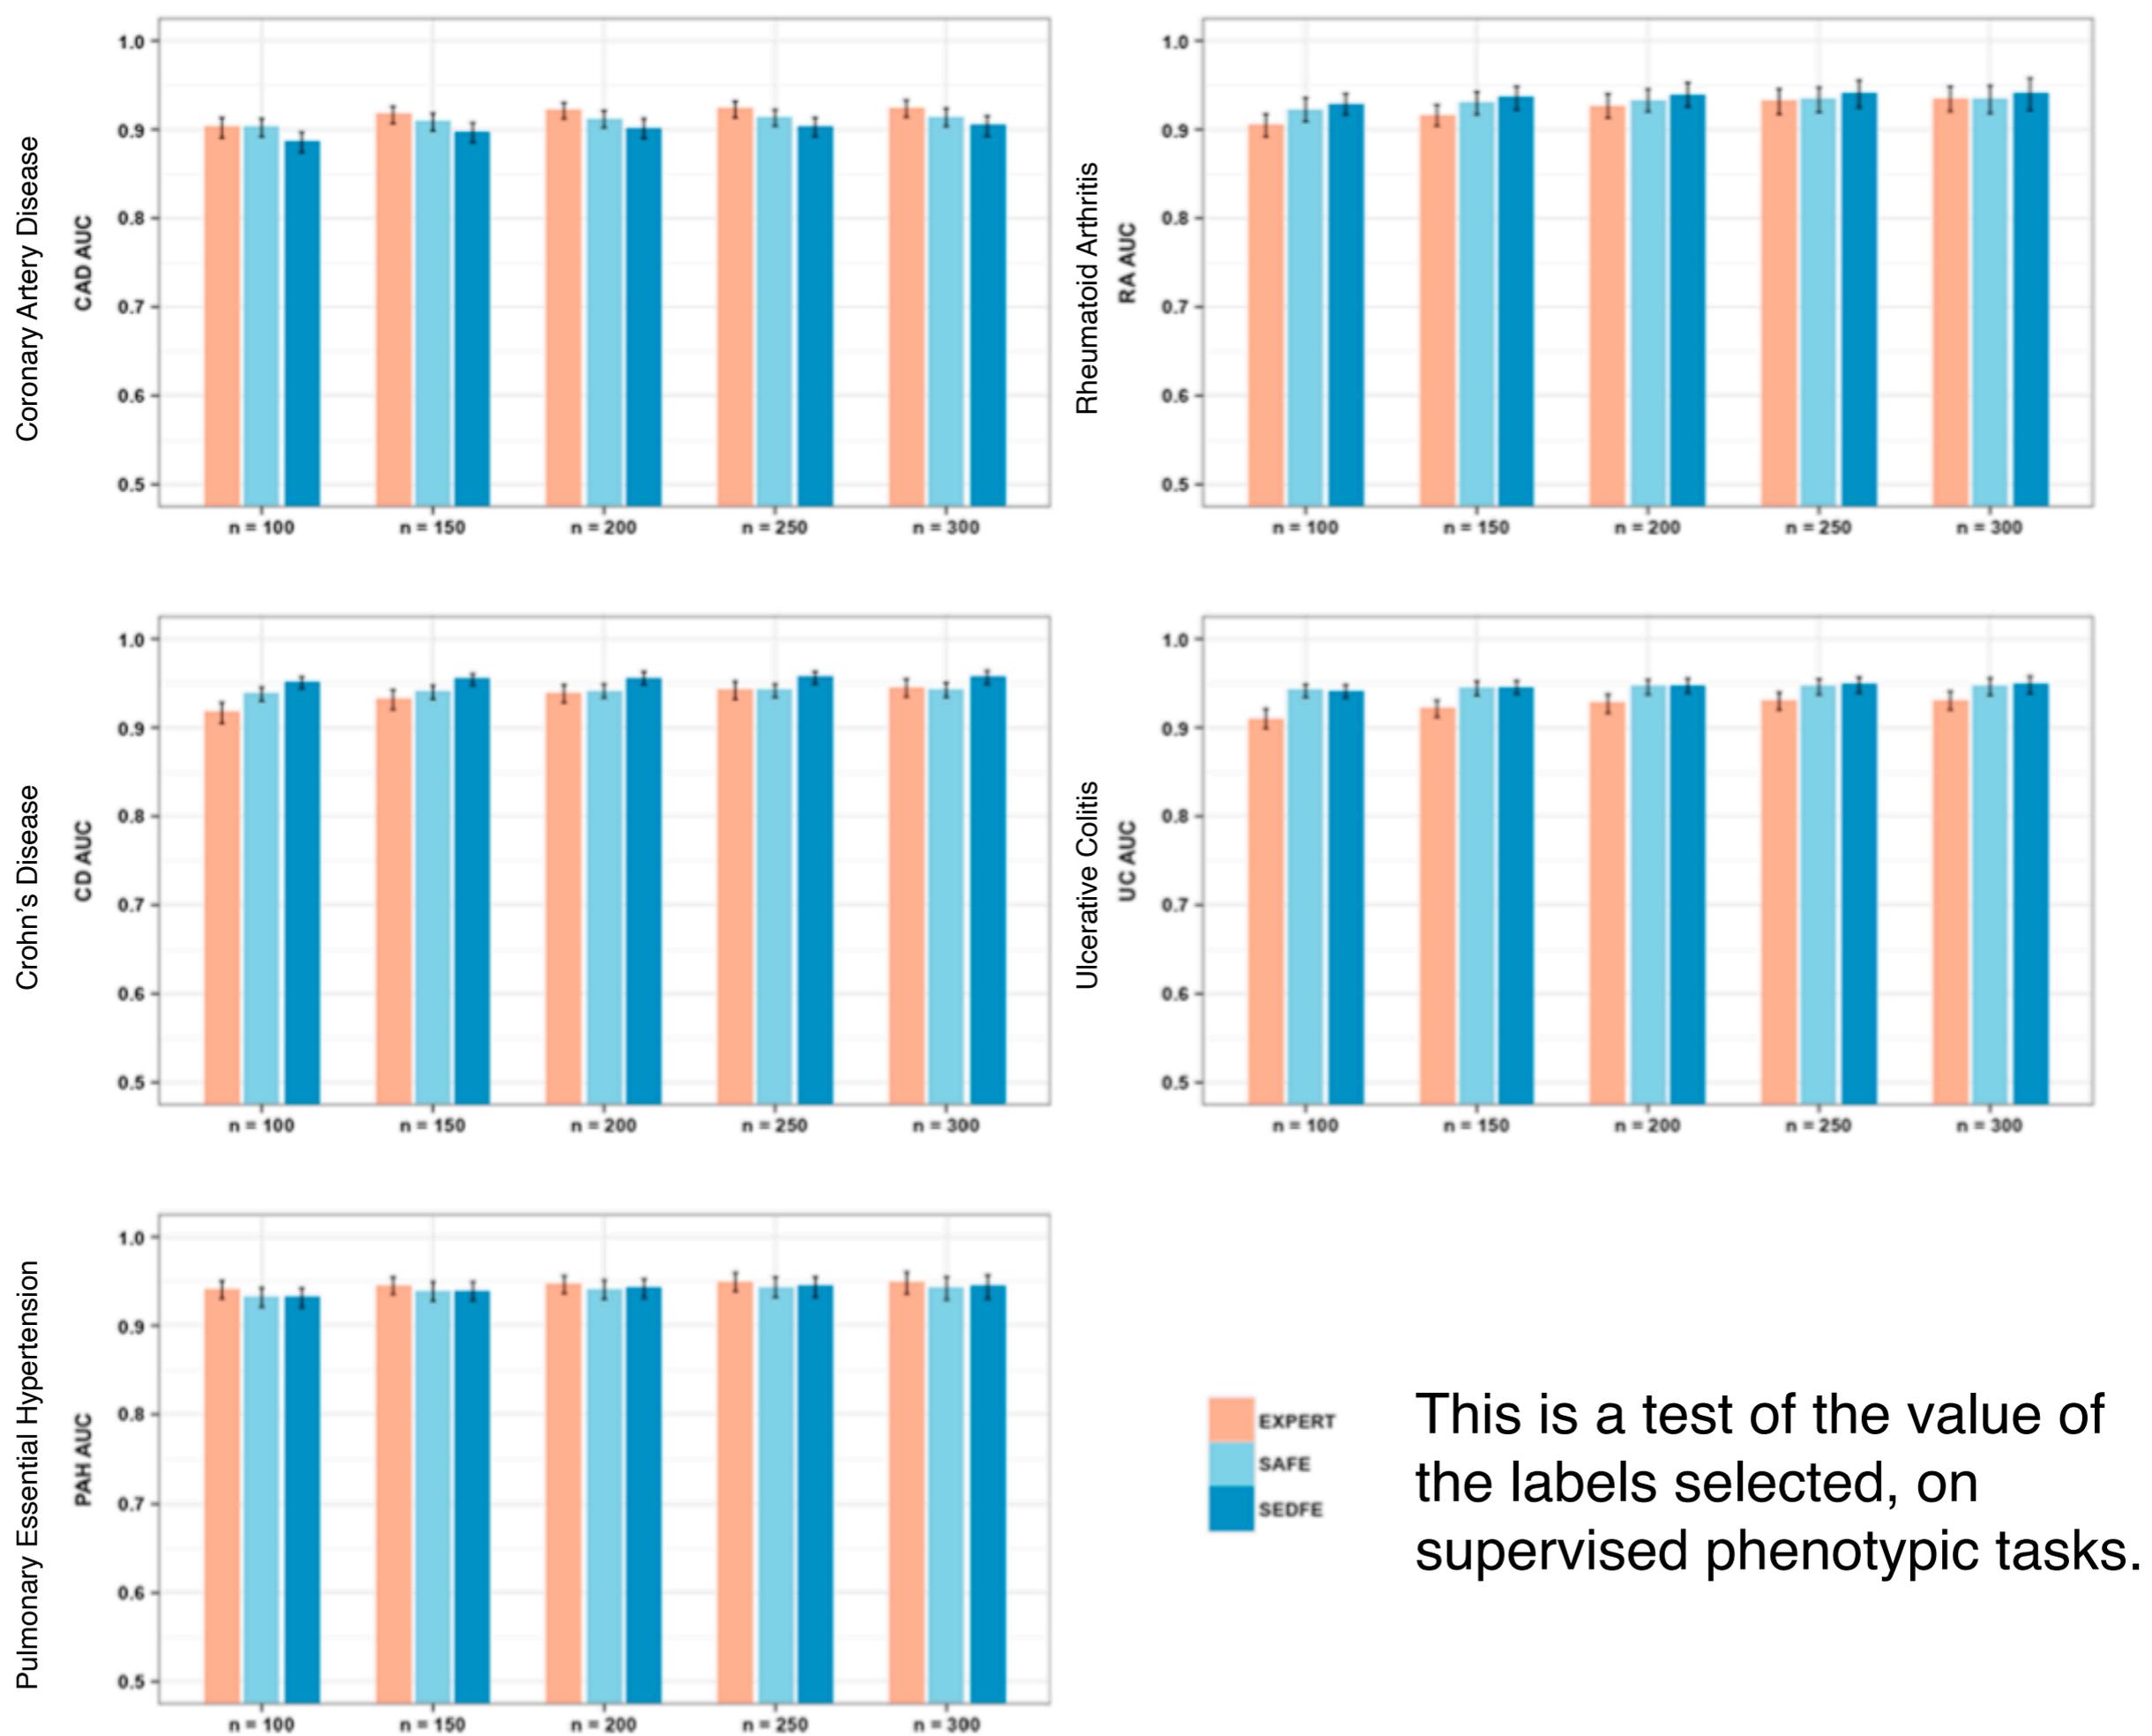

- Used to create phenotypes for coronary artery disease (CAD), rheumatoid arthritis (RA), Crohn's disease (CD), ulcerative colitis (UC), and pediatric pulmonary arterial hypertension (PAH)

Number of features from various methods.

	Phenotype				
	CAD	RA	CD	UC	PAH
Number of concepts extracted from source articles	805	1067	1057	700	58
Number of expert-curated features <sup>a</sup>	34	21	47	48	24
Number of features from SAFE	19	15	16	17	28
Number of features from SEDFE	36	26	18	27	35

<sup>a</sup> The source of PAH features in the original study includes both expert curation and algorithm selection.

	AFEP	SAFE	SEDFE
Commonality	Applies NER to online articles about the target phenotype to find an initial list of clinical concepts as candidate features		
Feature selection method	Frequency control, then threshold by rank correlation with the NLP feature representing the target phenotype	Frequency control, majority voting, then use sparse regression to predict the silver-standard labels derived from surrogate features	Majority voting; Use concept embedding to determine feature relatedness; Use semantic combination and the BIC to determine the number of needed features
Data requirement	EHR data (hospital dependent and not sharable)	EHR data (hospital dependent and not sharable)	A biomedical corpus for training word embedding (usually sharable)
Tuning parameters	Threshold for the rank correlation	(1) Upper and lower thresholds of the surrogate features for creating the silver standard labels, which are affected by the distribution of the features, and therefore phenotype dependent; (2) The number of patients to sample, which affects the number of selected features	The word embedding parameters, which are not overly sensitive. The embedding is done only once for all phenotypes

This is a test of the value of the labels selected, on supervised phenotypic tasks.

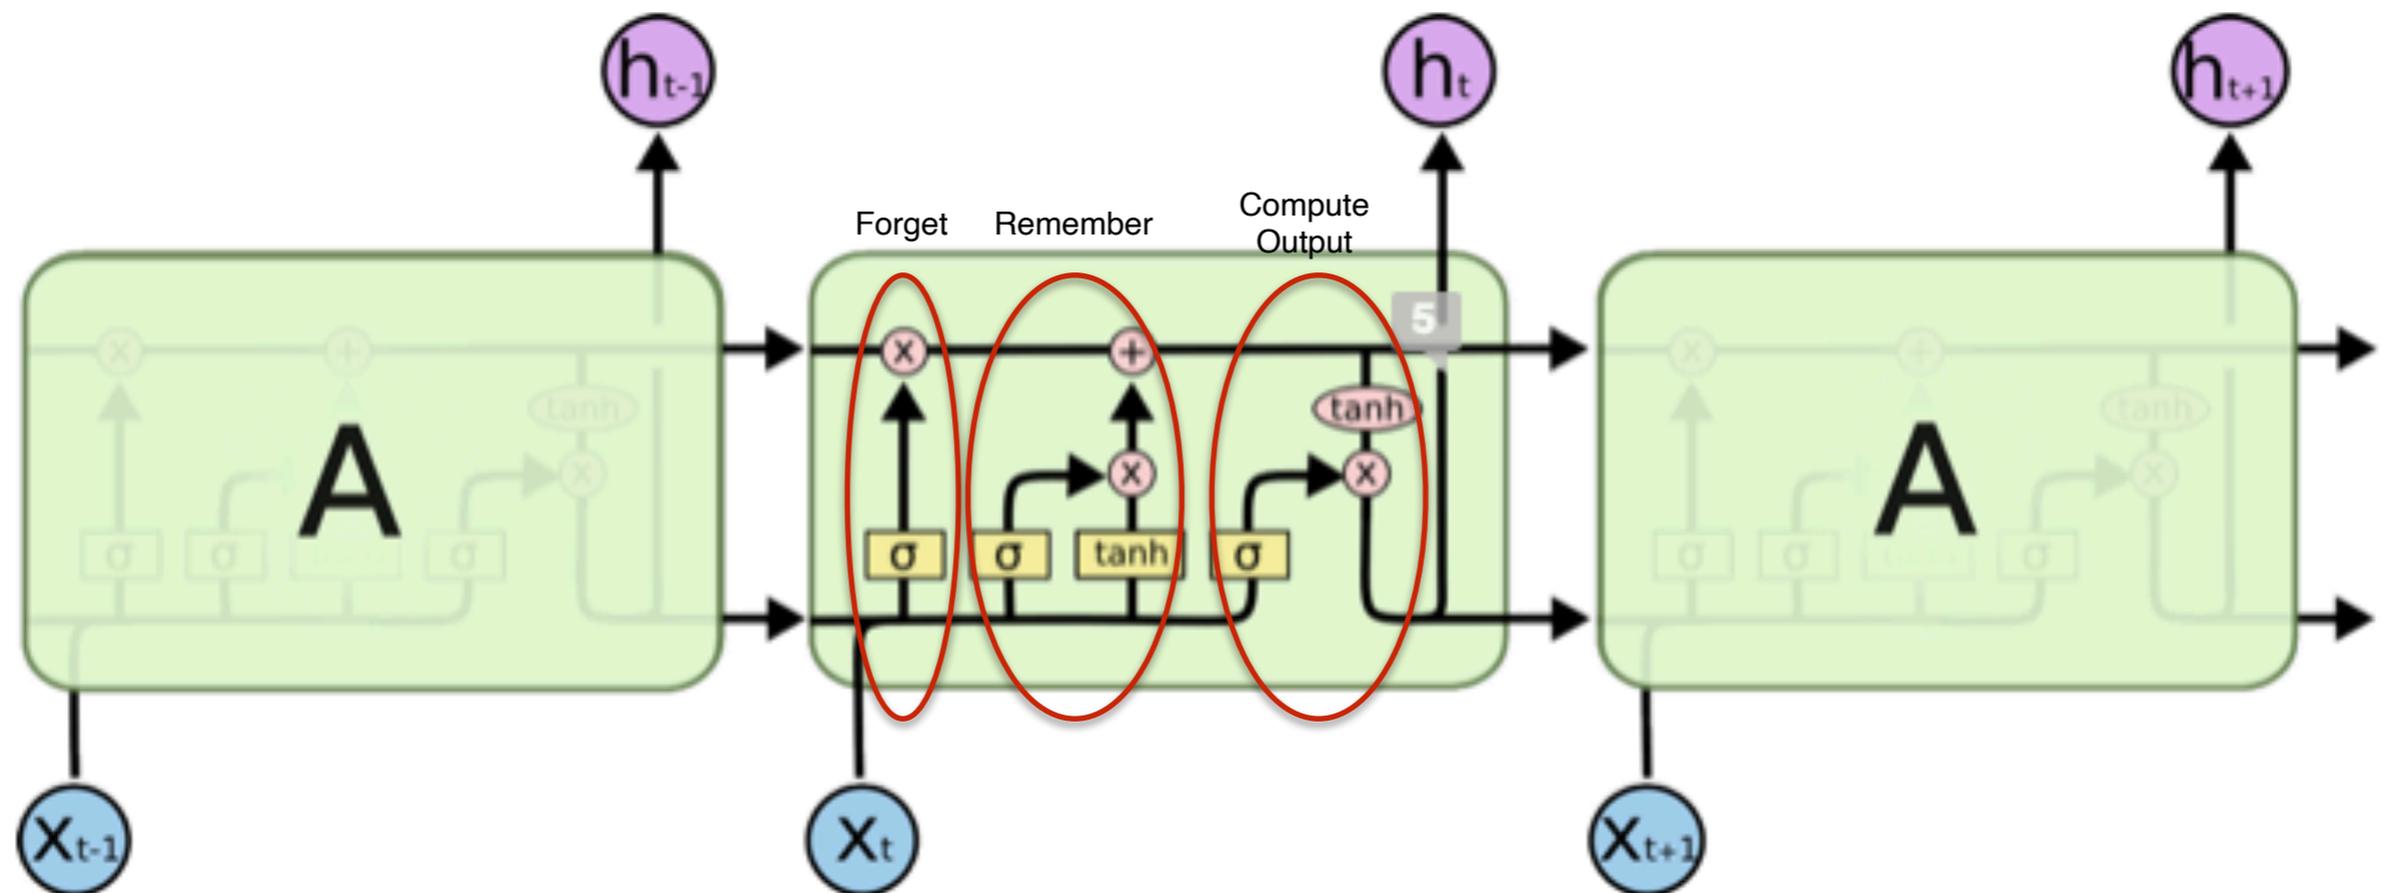

Fig. 3. AUC of supervised algorithms trained with features selected by EXPERT, SAFE, and SEDFE.

# Neural Language Modeling Key Ideas

---

- Can build arbitrarily complex models so long as they are differentiable
  - Then, they can be trained by SGD
- Pre-training on arbitrarily large unannotated corpora
  - Then, adapt via fine-tuning or even few-shot learning

# Long Short-Term Memory (LSTM)

The repeating module in an LSTM contains four interacting layers.

# ELMo — (Contextual) Embellings from Language Models

---

- Bidirectional LSTM
- Builds models for every *token*, not just for every *type*
  - i.e., different embeddings for the same word in different contexts
  - basis for word-sense disambiguation
- Significantly improves performance on nearly all NLP tasks

	Source	Nearest Neighbors
GloVe	play	playing, game, games, played, players, plays, player, Play, football, multiplayer
biLM	Chico Ruiz made a spectacular <u>play</u> on Alusik 's grounder {...}	Kieffer , the only junior in the group , was commended for his ability to hit in the clutch , as well as his all-round excellent <u>play</u> .
	Olivia De Havilland signed to do a Broadway <u>play</u> for Garson {...}	{...} they were actors who had been handed fat roles in a successful <u>play</u> , and had talent enough to fill the roles competently , with nice understatement .

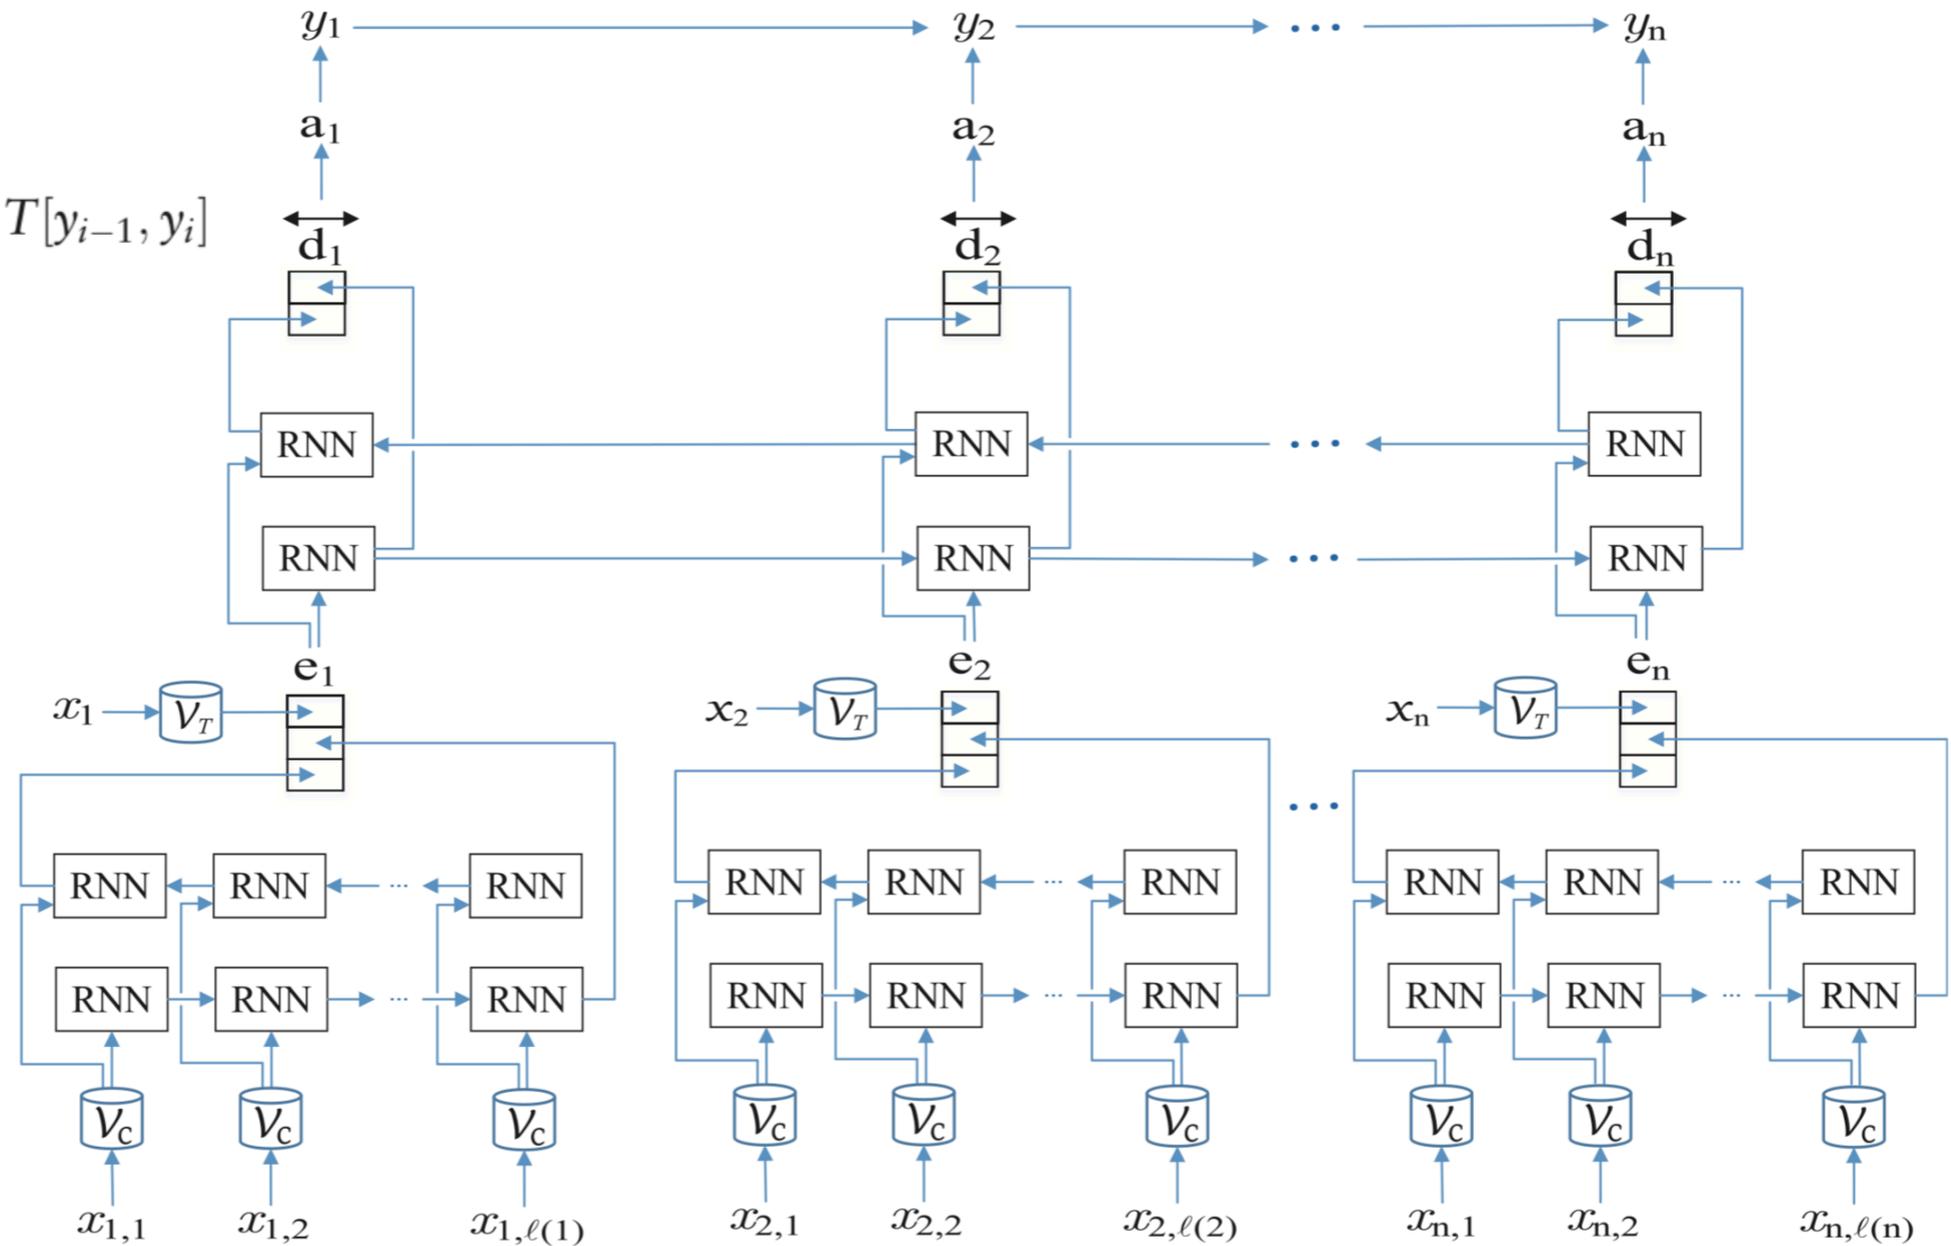

Table 4: Nearest neighbors to “play” using GloVe and the context embeddings from a biLM.

# ANN model for de-identification

But ELMO's goal is to compute an embedding for each token, not to solve a particular problem. Then stack with downstream task!

- Label-sequence optimization layer
- Label prediction layer
- Character-enhanced token-embedding layer

$$s(y_{1:n}) = \sum_{i=1}^n a_i[y_i] + \sum_{i=2}^n T[y_{i-1}, y_i]$$

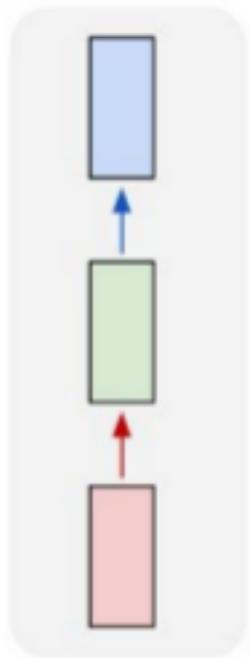

**Figure 1.** Architecture of the artificial neural network (ANN) model. (RNN, recurrent neural network.) The type of RNN used in this model is long short-term memory (LSTM).  $n$  is the number of tokens, and  $x_i$  is the  $i^{\text{th}}$  token.  $\mathcal{V}_T$  is the mapping from tokens to token embeddings.  $\ell(i)$  is the number of characters and  $x_{i,j}$  is the  $j^{\text{th}}$  character in the  $i^{\text{th}}$  token.  $\mathcal{V}_C$  is the mapping from characters to character embeddings.  $e_i$  is the character-enhanced token embeddings of the  $i^{\text{th}}$  token.  $\vec{d}_i$  is the output of the LSTM of the label prediction layer,  $a_i$  is the probability vector over labels,  $y_i$  is the predicted label of the  $i^{\text{th}}$  token.

# Sequence-to-Sequence models

- Natural application: machine translation
  - But also usable for question-answer problems
  - Equivalence and natural implication problems
  - Conversion from text to some formal representation

# Machine Translation by Sequence to Sequence Models

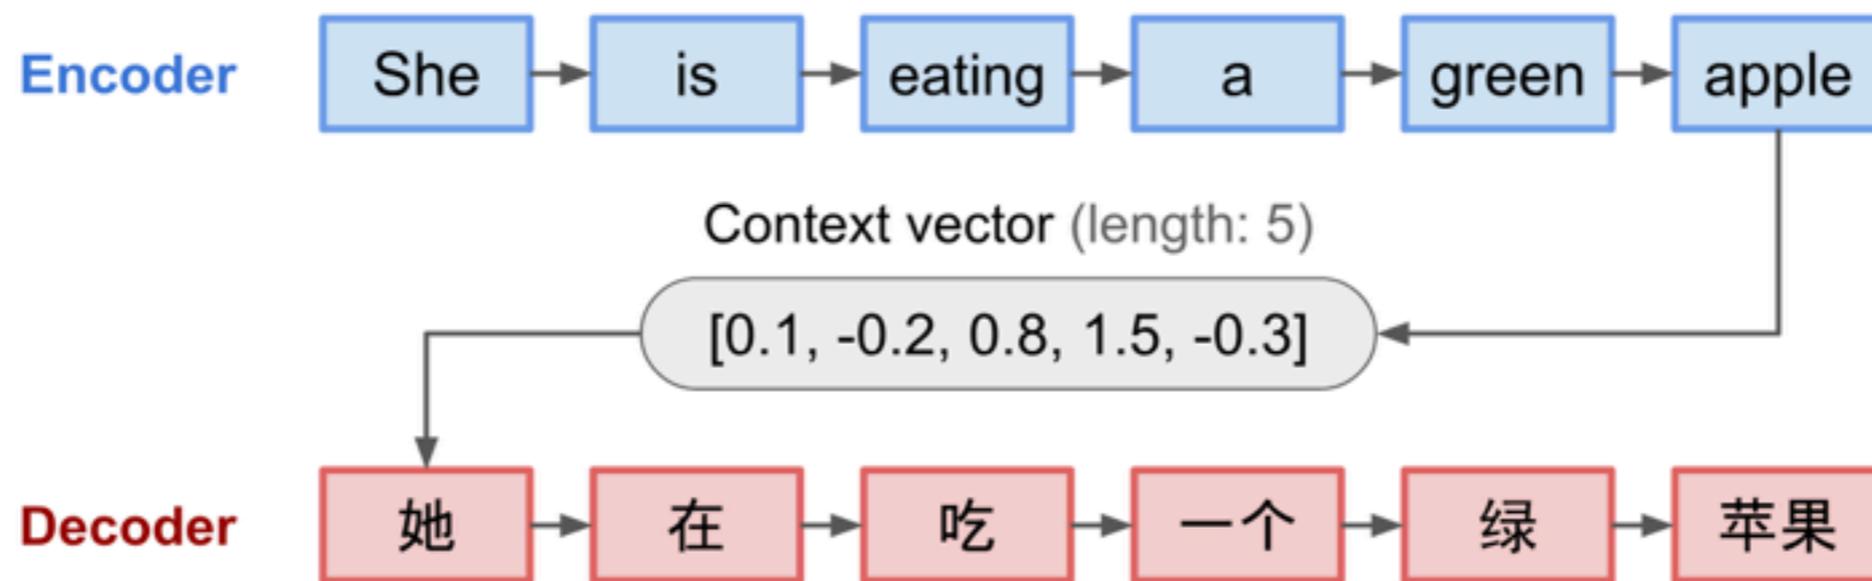

Fig. 3. The encoder-decoder model, translating the sentence "she is eating a green apple" to Chinese. The visualization of both encoder and decoder is unrolled in time.

# Sequence to Sequence Models for Machine Translation

---

- Multi-layered LSTM to summarize input to a vector,  $v$
- Output depends on that vector and the previously generated words

$$p(y_1, \dots, y_{T'} | x_1, \dots, x_T) = \prod_{t=1}^{T'} p(y_t | v, y_1, \dots, y_{t-1})$$

- where  $p(y_t | v, y_1, \dots, y_{t-1})$  is computed by a softmax over the vocabulary  $y$
- Beam search used to explore “best” partial translations
- $\Rightarrow$  Part of the revolutionary improvement in MT by Google
- But, some troubling issues:
  - Reversed input to bring *some*  $x, y$  pairs closer together because even LSTM “forgets” longer-range dependencies
  - BLEU score (34.8) > that of a phrase-based MT system (33.3)
    - but re-ranking top-1000 outputs of the phrase-based system  $\Rightarrow$  36.5, so, model fails to capture everything important

# Clustering of Encodings of Similar Input Sentences

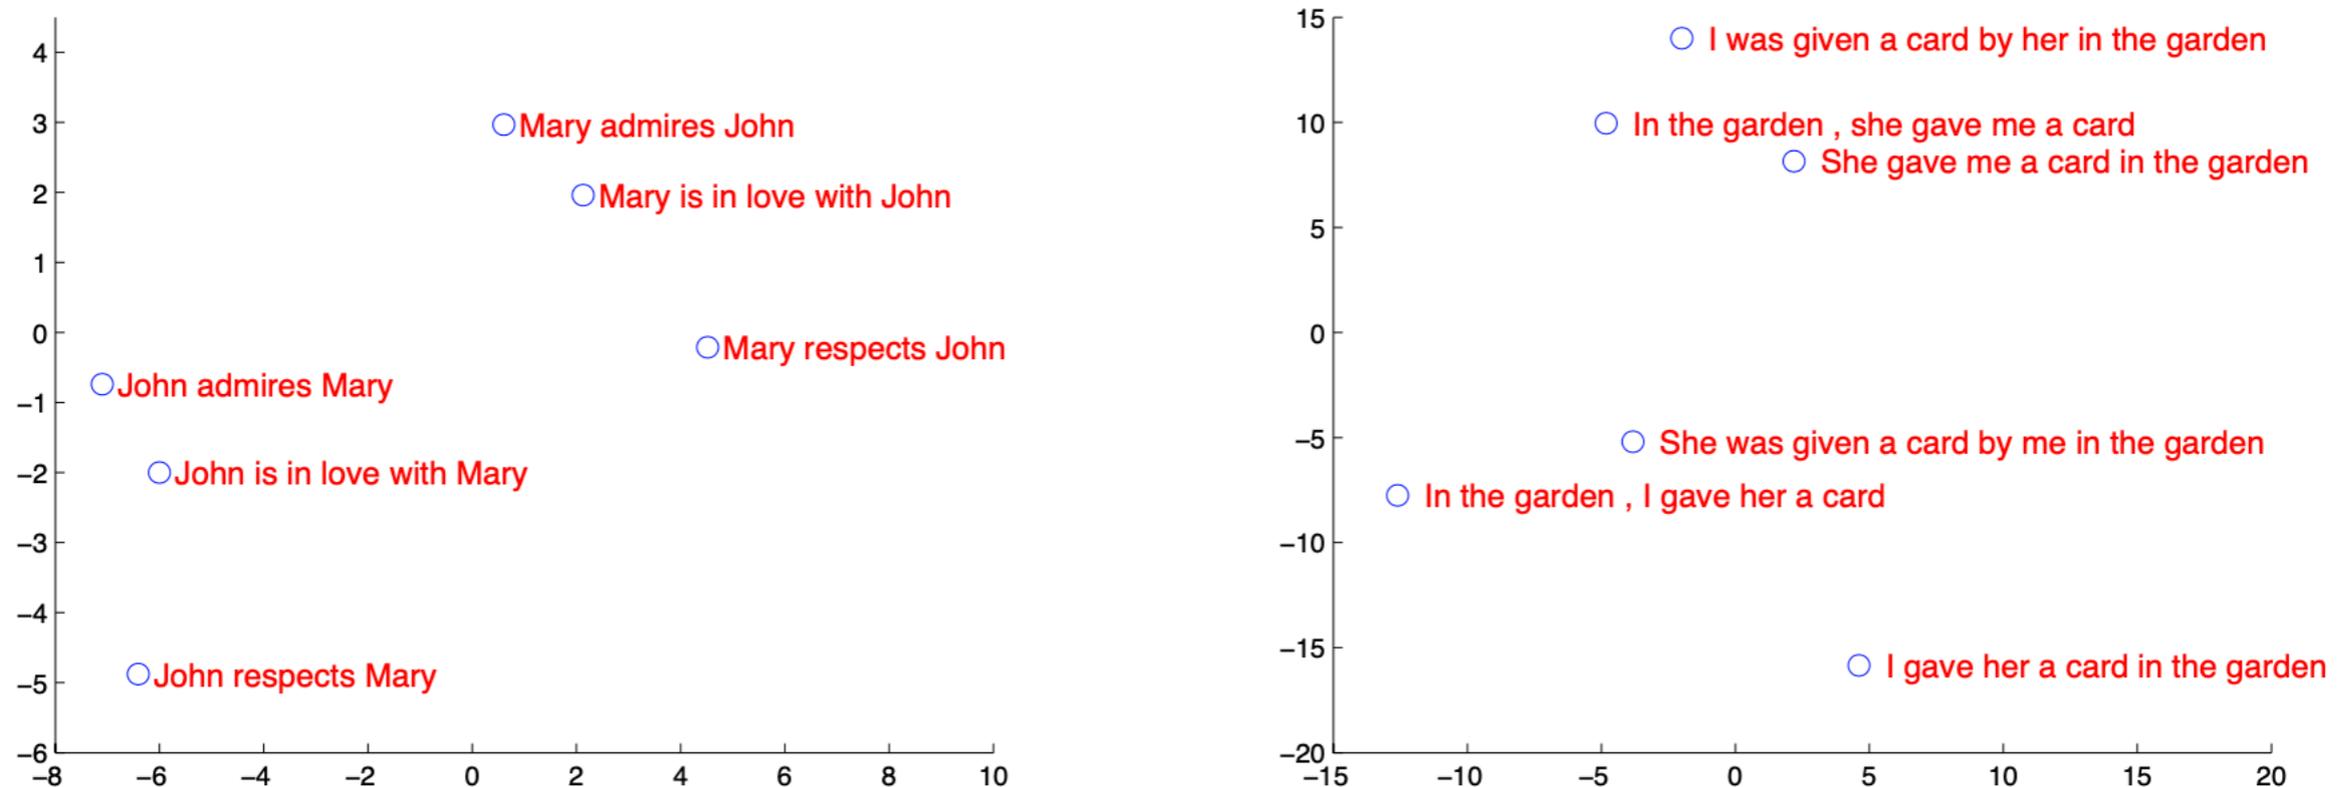

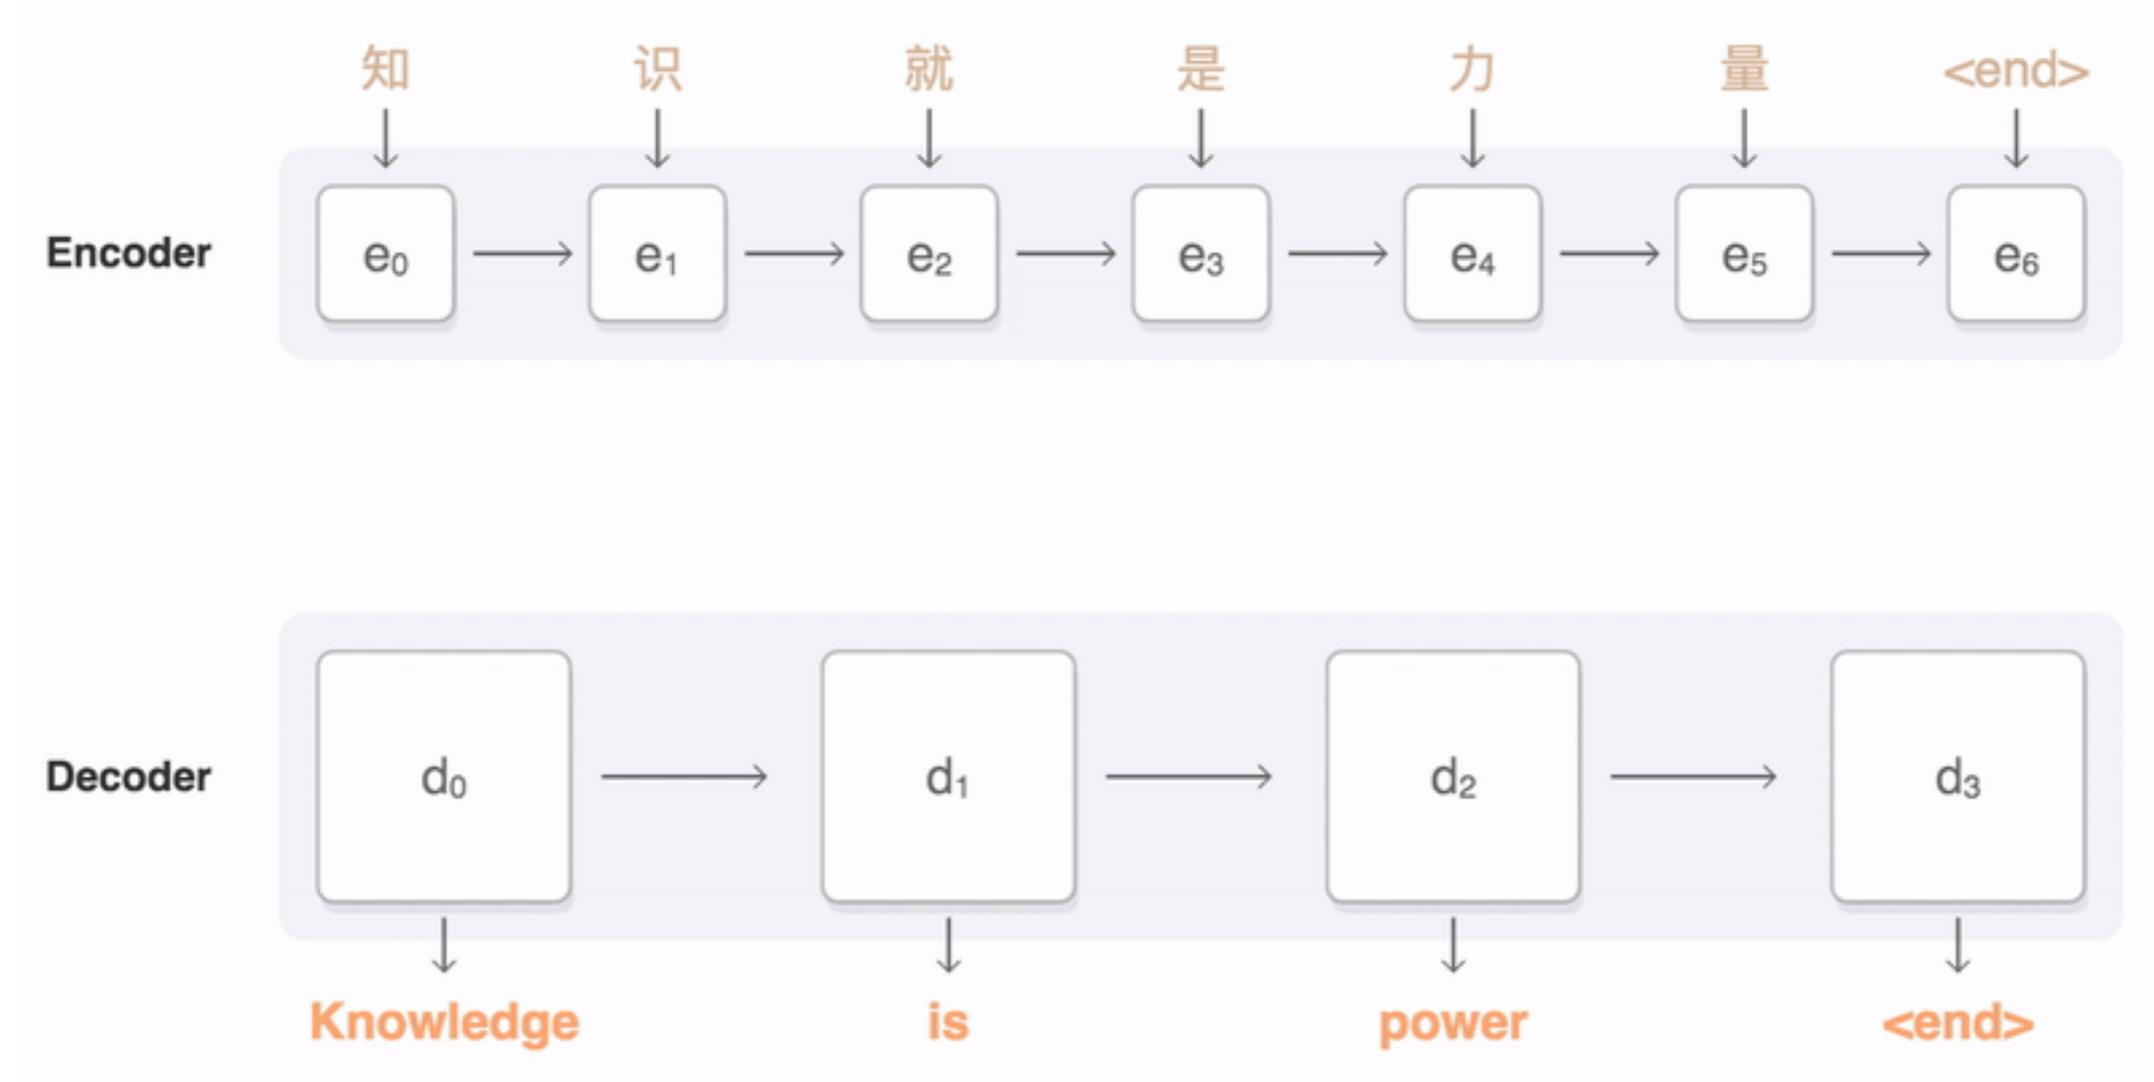

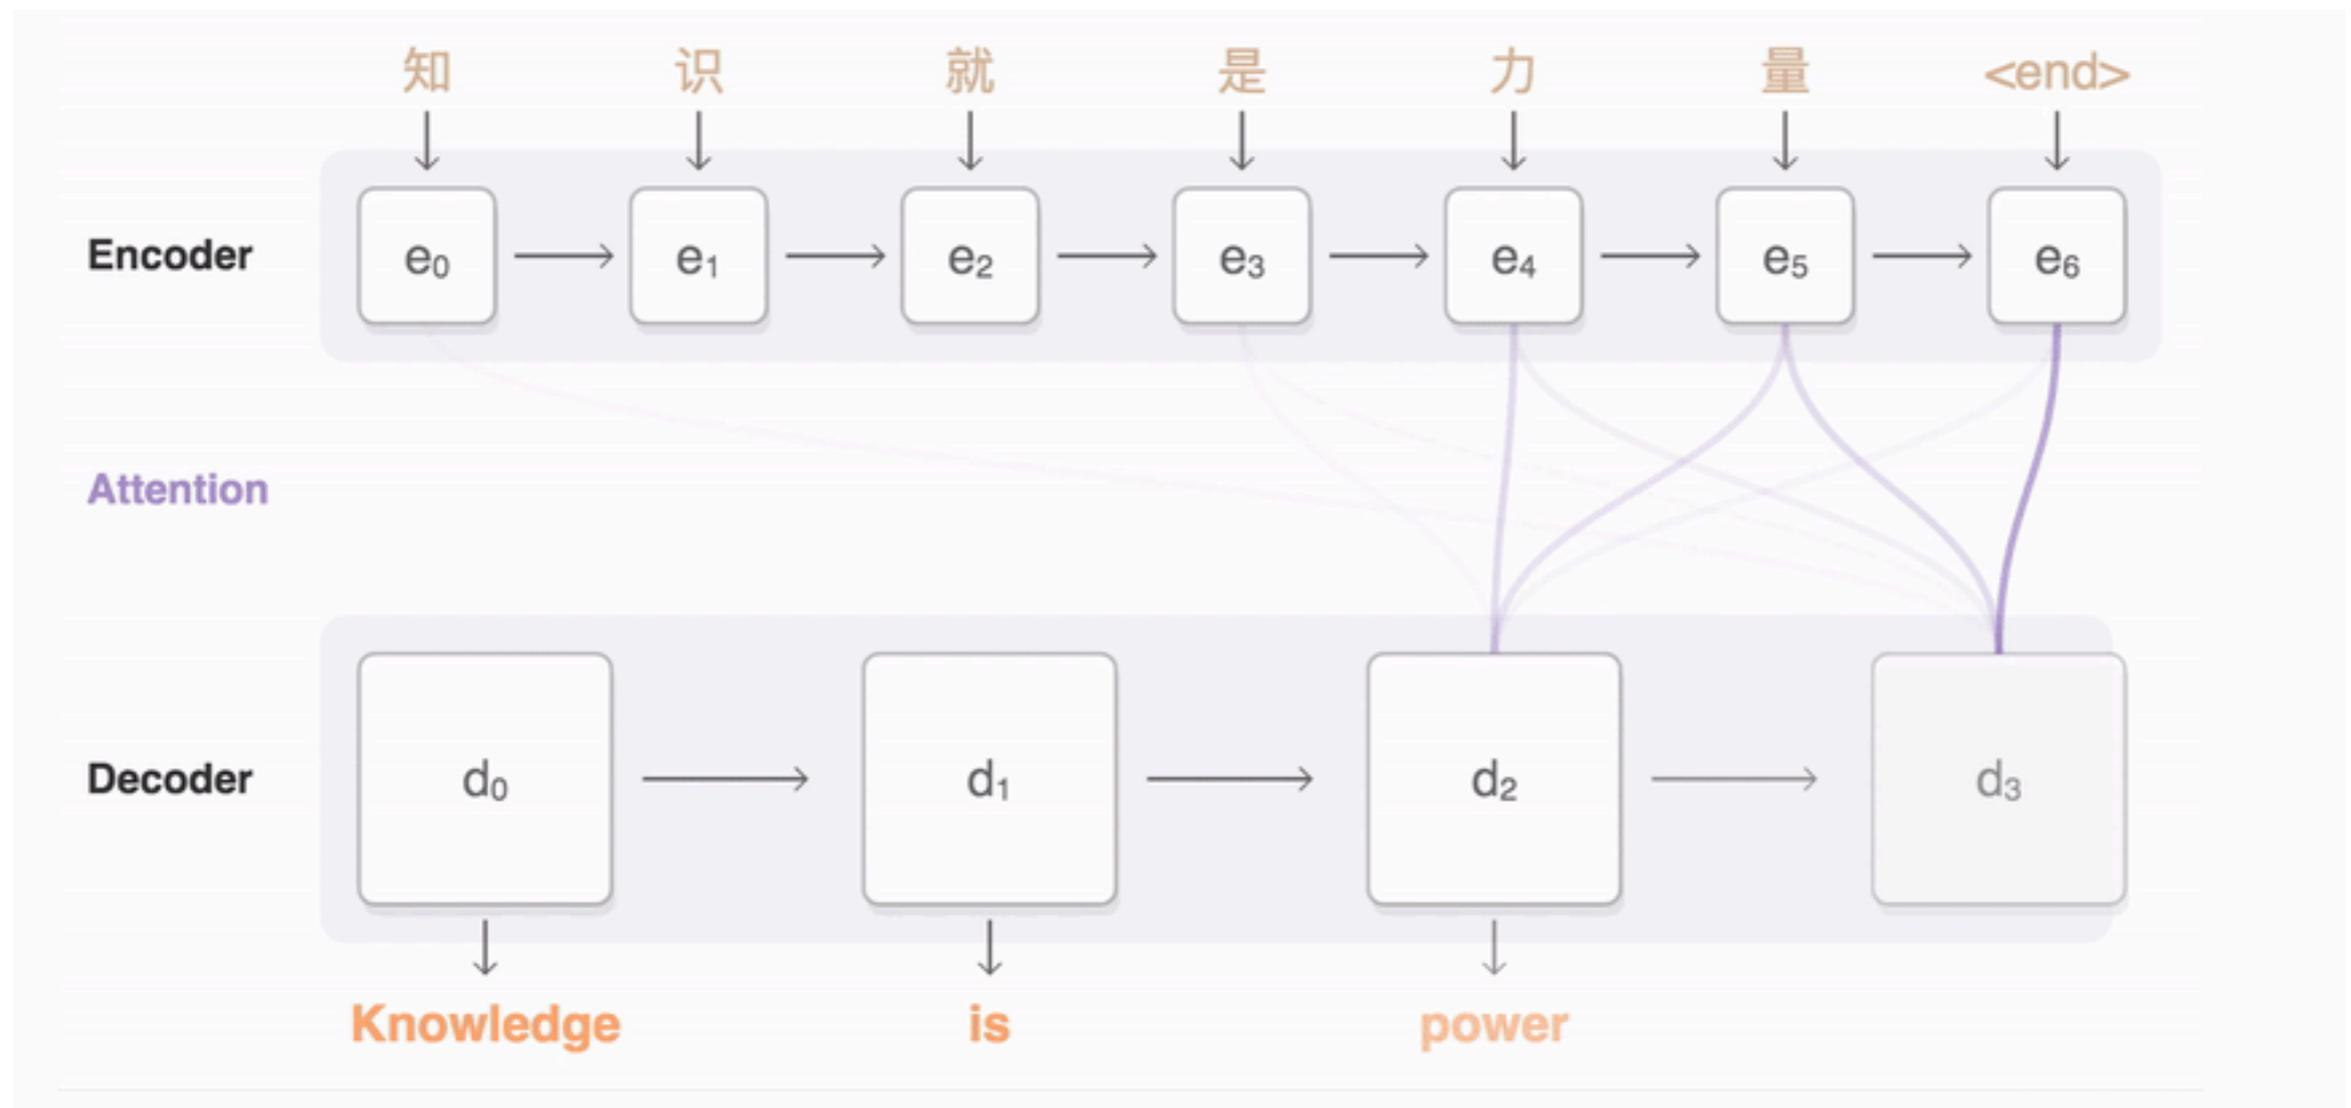

Figure 2: The figure shows a 2-dimensional PCA projection of the LSTM hidden states that are obtained after processing the phrases in the figures. The phrases are clustered by meaning, which in these examples is primarily a function of word order, which would be difficult to capture with a bag-of-words model. Notice that both clusters have similar internal structure.

# Adding Attention to the Seq2Seq Model

# Illustration of Learned Attention Weights

# How to Model the Attention Weights

- Attention depends on:
  - score of relationship between word being generated and all input words [“dictionary”]
  - learned positional dependencies [“alignment”]

• State of the decoder  $s_t = f(s_{t-1}, y_{t-1}, \mathbf{c}_t)$ ,  $t = 1, \dots, m$  where  $\mathbf{c}_t = \sum_{i=1}^n \alpha_{t,i} \mathbf{h}_i$

- where  $\mathbf{h}_i$  are all the  $i$ -th word encoder states and  $\alpha_{t,i}$  are the learned alignment weights

- $f$  can take various forms:

$$\cos(s_t, \mathbf{h}_i)$$

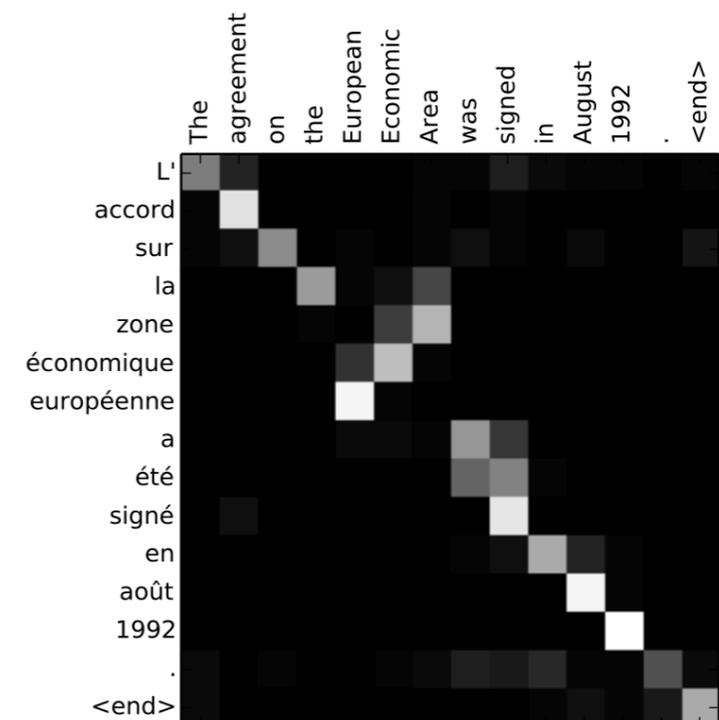

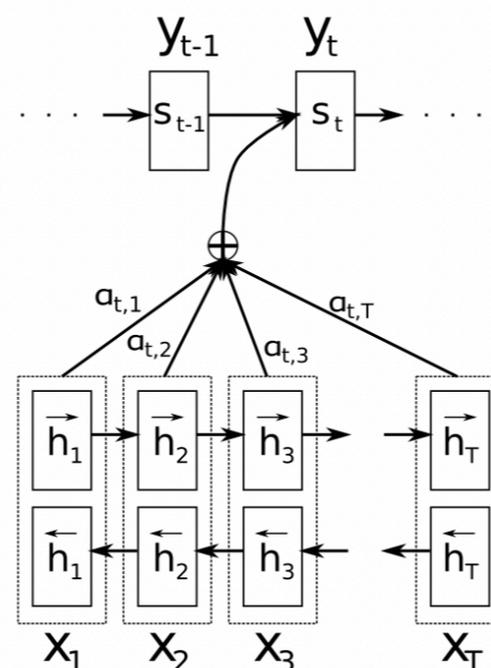

$$s_t^\top \mathbf{h}_i$$

$$s_t^\top \mathbf{W}_a \mathbf{h}_i$$

$$\mathbf{v}_a^\top \tanh(\mathbf{W}_a [s_t; \mathbf{h}_i])$$

$$\text{softmax}(\mathbf{W}_a s_t)$$

$$s_t^\top \mathbf{h}_i / \sqrt{n}$$

# “Attention is All You Need” (next time)

---

- Vaswani A, Shazeer N, Parmar N, Uszkoreit J, Jones L, Gomez AN, et al. Attention is all you need. In: NeurIPS. 2017. Available from: <https://proceedings.neurips.cc/paper/2017/file/3f5ee243547dee91fbd053c1c4a845aa-Paper.pdf>
- 66,919 citations, as of March 1, 2023!
  - By comparison, Watson & Crick’s 1953 Nature paper on the structure of DNA has 17,264 citations
    - However, this involves a domain and time shift!!!
